Cosmic Biology Louis Neal Irwin,Dirk

Schulze-Makuch,2010-12-08 In *Cosmic Biology* Louis Irwin and Dirk Schulze Makuch guide readers through the range of planetary habitats found in our Solar System and those likely to be found throughout the universe Based on our current knowledge of chemistry energy and evolutionary tendencies the authors envision a variety of possible life forms These range from the familiar species found on Earth to increasingly exotic examples possible under the different conditions of other planets and their satellites Discussions of the great variety of life forms that could evolve in these diverse environments have become particularly relevant in recent years with the discovery of around 300 exoplanets in orbit around other stars and the possibilities for the existence of life in these planetary systems The book also posits a taxonomic classification of the various forms of life that might be found including speculation on the relative abundance of different forms and the generic fate of living systems The fate and future of life on Earth will also be considered The closing passages address the Fermi Paradox and conclude with philosophical reflections on the possible place of Homo sapiens in the potentially vast stream of life across the galaxies

Exoplanets, The Frontier of Modern Astronomy Denzel Carter Jackson, Exoplanets have been found in a relatively small region of our galaxy the Milky Way According to NASA's Kepler Space Telescope there are more planets in the universe than stars Our solar system's exoplanets comprise similar elements to our planets but their mixtures may differ By measuring the sizes diameters and masses weights of exoplanets we can determine their compositions which range from very rocky like Earth and Venus to very gaseous like Jupiter and Saturn Some planets may be dominated by water ice or iron while others are dominated by iron or carbon A stellar world with lava seas a puffy planet and a planet whose core is as dense as Styrofoam have been identified Since then we've discovered thousands of exoplanets using various detection methods From Earth it is infrequent to see an exoplanet through a telescope the way you might see Saturn Direct imaging has only been used to find a handful of exoplanets and these are usually young gas giants orbiting very far from their stars Exoplanets are now part of our universe There are thousands of confirmed planets This is only a tiny part of the entire galaxy As we increase the number and observing power of robotic telescopes deployed in space the number could rise into the tens of thousands within a decade Since then we've discovered thousands of exoplanets using various detection methods From Earth it is infrequent to see an exoplanet through a telescope the way you might see Saturn That's called direct imaging and only a handful of exoplanets have been found this way and these are young gas giant planets orbiting very far from their stars Exoplanets are now part of our universe Thousands of planets have been confirmed This is only a tiny sampling of the galaxy By deploying more robotic telescopes into space we will see tens of thousands of stars within a decade

Seven years of research 2017 to 2024 The Earth as a Distant Planet M. Vázquez,E. Pallé,P. Montañés Rodríguez,2010-03-12 In The Earth as a Distant Planet the authors become external observers of our solar system from a distance and try to determine how one can understand how Earth the third in distance to the central star is essentially unique and capable of sustaining life The knowledge gained from this original perspective is then applied to the search for other planets outside the solar system or exoplanets Since the discovery in 1992 of the first exoplanet the number of planet detections has increased exponentially and ambitious missions are already being planned for the future The exploration of Earth and the rest of the rocky planets are Rosetta stones in classifying and understanding the multiplicity of planetary systems that exist in our galaxy In time statistics on the formation and evolution of exoplanets will be available and will provide vital information for solving some of the unanswered questions about the formation as well as evolution of our own world and solar system Special attention is paid to the biosignatures signs of life detectable in the Earth s reflected spectra and the search for life in the universe The authors are experts on the subject of extrasolar planets They provide an introductory but also very much up to date text making this book suitable for researchers and for advanced students in astronomy and astrophysics **29th International Symposium on Shock Waves 1** Riccardo Bonazza,Devesh Ranjan,2015-07-09 This proceedings present the results of the 29th International Symposium on Shock Waves ISSW29 which was held in Madison Wisconsin U S A from July 14 to July 19 2013 It was organized by the Wisconsin Shock Tube Laboratory which is part of the College of Engineering of the University of Wisconsin Madison The ISSW29 focused on the following areas Blast Waves Chemically Reactive Flows Detonation and Combustion Facilities Flow Visualization Hypersonic Flow Ignition Impact and Compaction Industrial Applications Magnetohydrodynamics Medical and Biological Applications Nozzle Flow Numerical Methods Plasmas
