ENGINE OPERATION

The following is a general discussion of a typical two-stroke piston-ported engine. The same principles apply to engines with reed type intake valves, except that during the intake cycle, the fuel/air mixture passes through the open reed valve assembly into the crankcase. During this discussion, assume the crankshaft is rotating counterclockwise as in **Figure 8**. As the piston travels downward, a transfer port (A) between the crankcase and the cylinder is uncovered. The exhaust gases leave the cylinder through the exhaust port (B), which is also opened by the downward movement of the piston. A fresh fuel/air charge, which has been previously compressed slightly, travels from the crankcase (C) to the cylinder through the transfer port (A) as the port opens. Since the incoming charge is under pressure, it rushes into the cylinder quickly and helps to expel the exhaust gases from the previous cycle.

Figure 9 illustrates the next phase of the cycle. As the crankshaft continues to rotate, the piston moves upward, closing the exhaust and transfer ports. As the piston continues upward, the air/fuel mixture in the cylinder is compressed. Notice also that a vacuum is created in the crankcase at the same time. Further upward movement of the piston uncovers the intake port (D). A fresh fuel-air charge is then drawn into the crankcase through the intake port because of the vacuum created by the upward piston movement.

The third phase is shown in **Figure 10**. As the piston approaches top dead center, the spark plug fires, igniting the compressed mixture. The piston is then driven downward by the expanding

gases. Every downward stroke of the piston is a power stroke.

When the top of the piston uncovers the exhaust port, the fourth phase begins, as shown in **Figure 11**. The exhaust gases leave the cylinder
