through the valveless tube heart at a rate that surpasses the contractions of its walls suggesting that the blood is not propelled by the heart but possesses its own motive force tightly coupled to the metabolic demands of the tissues. Rather than being an organ of propulsion the heart on the contrary serves as a damming up organ generating pressure by rhythmically impeding the flow of blood. The validity of this model is then confirmed by comparing the key developmental stages of the cardiovascular system in the invertebrates, the insects and across the vertebrate taxa. The salient morphological and histological features of the myocardium are reviewed with particular reference to the vortex. The complex energy dissipating intracardiac flow patterns likewise suggest that the heart functions as an organ of impedance whose energy consumption closely matches the generated pressure but not its throughput. Attention is then turned to the regulation of cardiac output and to the arguments advanced by proponents of the left ventricular and of the venous return models of circulation. Hyperdynamic states occurring in arteriovenous fistulas and congenital heart defects where communication exists between the systemic and pulmonary circuits at the level of atria or the ventricles demonstrate that once the heart is unable to impede the flow of blood reactive changes occur in the pulmonary and systemic circulations leading to pulmonary hypertension and Eisenmenger syndrome. Finally the key points of the book are summarized in the context of blood as a liquid organ with autonomous movement.

Animal Life at Low Temperature John Davenport, 2012-12-06 To humans cold has a distinctly positive quality. Frostbite, a nip in the air, biting cold all express the concept of cold as an entity which attacks the body, numbing and damaging it in the process. Probably the richness of descriptive English in this area stems from the early experiences of a group of essentially tropical apes making their living on a cold and windswept island group half way between the Equator and the Arctic. During a scientific education we soon learn that there is no such thing as cold, only an absence of heat. Cold does not invade us, heat simply deserts. Later still we come to appreciate that temperature is a reflection of kinetic energy and that the quantity of kinetic energy in a system is determined by the speed of molecular movement. Despite this realization it is difficult to abandon the sensible prejudices of palaeolithic Homo sapiens shivering in his huts and caves. For example, appreciating that a polar bear is probably as comfortable when swimming from ice floe to ice floe as we are when swimming in the summer Mediterranean is not easy. Understanding the thermal sensations of a cold blooded earthworm is virtually impossible. We must always be wary of an anthropocentric attitude.
