Co-simulations of Microwave Circuits and High-Frequency Electromagnetic Fields Mei Song Tong, Xiao Yu Li, 2024-07-03 This book aims to provide many advanced application topics for microwave circuits and high frequency electromagnetic EM fields by using advanced design system ADS and high frequency structure simulator HFSS as simulation platforms In particular it contains the latest multidisciplinary co simulation guidance on the design of relevant components and devices Currently the circuit field design and performance analysis and optimization strongly rely on various kinds of robust electronic design automation EDA software RF microwave engineers must grasp two or more types of related simulation design software ADS by Keysight and HFSS by Ansys are the representative for circuit simulations and for field and structural simulations of microwave devices respectively At present these two types of software are widely used in enterprises universities and research institutions The main purpose of this book is to enable readers who are interested in microwave engineering and applied electromagnetics to master the applications of these two tools It also helps readers expand their knowledge boundaries behind those types of software and deepen their understanding of developing interdisciplinary technologies by co simulations The book is divided into three parts The first part introduces the two latest

versions of ADS and HFSS and helps readers better understand the basic principles and latest functions better. It also advises how to choose appropriate simulation tools for different problems. The second part mainly describes co-simulations for high frequency EM fields, microwave circuits, antenna designs, EM compatibility, EMC, and thermal and structural analyses. It provides guides and advices on performing co-simulations by ADS and HFSS incorporated with other types of software respectively. The last part narrates the automation interfaces and script programming methods for co-simulations. It primarily deals with the Advanced Extension Language (AEL), Python Data Link (PDL), and MATLAB interface in ADS. For HFSS, it discusses VBScript, IronPython scripting, and Application Programming Interface (APIs) based on MATLAB. Each topic contains practical examples to help readers understand so that they can gain a solid knowledge and skills regarding automated interfaces and scripting methods based on these kinds of software. Concisely written in combination with practical examples, this book is very suitable as a textbook in introductory courses on microwave circuit and EM simulations and also as a supplementary textbook in many courses on electronics, microwave engineering, communication engineering, and related fields. As well, it can serve as a reference book for microwave engineers and researchers.

Radio Frequency Identification and Sensors Etienne Perret, 2014-12-15. This book deals with the field of identification and sensors, more precisely the possibility of collecting information remotely with RF waves. RFID. The book introduces the technology of chipless RFID, starting from classical RFID and barcode and explores the field of identification and sensors without wire, without batteries, without chip, and with tags that can even be printed on paper. A technique for automatic design of UHF RFID tags is presented, aiming at making the tags as insensitive as possible to the environment, with the ability to increase the reading range, reliability, or conversely making them sensitive in order to produce sensors, meanwhile keeping their unique ID. The RFID advantages are discussed along with its numerous features and comparisons with the barcode technology are presented. After that, the new chipless RFID technology is introduced on the basis of the previous conclusions. Original technological approaches are introduced and discussed in order to demonstrate the practical and economic potential of the chipless technology.

Microwave De-embedding Ilcho Angelov, Gustavo Avolio, Dominique M.M.-P. Schreurs, 2013-11-09 Nonlinear models of

microwave transistors are essential for the design of high frequency nonlinear circuits such as power amplifiers or mixers. Among the existing modeling techniques measurement based approaches have gained huge attention from researchers in the last decades. Especially nonlinear measurements driven model extraction is preferred for transistors exploited in the design of power amplifiers and mixers. This chapter mainly deals with the generation of empirical transistor models starting from large signal time domain waveforms. Specifically a widely used model available in commercial CAD tools is adopted and the extraction procedure of the model parameters is outlined in detail. Moreover the advantage of using time domain waveforms at different frequencies is highlighted. More specifically by making use of time domain waveforms at frequencies in the kHz-MHz range one can separately model the behavior of the transistor output current generator which is more prone to low frequency dispersive effects. In fact at low frequencies the effect of the nonlinear transistor capacitance is significantly reduced and therefore already de embedded from the measured time domain waveforms. Once the model of the output current generator is available one can use high frequency measurements to determine the nonlinear capacitances or charges. Several modeling examples of different transistor technologies such as gallium arsenide and gallium nitride are reported.
