

Optics - The Study of Light

Refraction

Light refracts when passing between two substances at an angle.

Light does not bend as glass that is not yet within water. Bending begins at boundary between air and water.

Light bends away from the normal as it enters air from water. Bending begins at boundary between water and air.

The refractive index (n) is a constant value based on the light.

Reflection

Light reflects when it bounces off a surface.

Normal - an imaginary line 90° perpendicular to a surface.

Angle of Incidence - the angle between the incident ray and the normal.

Angle of Reflection - the angle between the reflected ray and the normal.

Focus

Many types of mirrors focus parallel waves of light passing close to axis. Focus is the point where all waves meet.

Rayleigh Scattering

Mirrors and lenses can make objects look bigger or smaller. Rayleigh scattering is the scattering of light by small particles in a medium.

Image vs. Object

The object is what you are looking at. The image is what you see.

The image is what you see when you look at the object. The image is what you see when you look at the object.

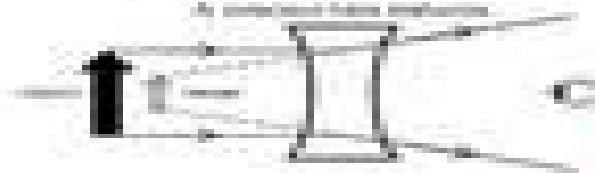

Image

Image is what you see when you look at the object. The image is what you see when you look at the object.

A convex lens is converging. The light rays converge.

A convex lens is converging. The light rays converge.

A concave lens is diverging. The light rays diverge.

A concave lens is diverging. The light rays diverge.

Image and object are separated by a distance. If the distance is small, the image is virtual. If the distance is large, the image is real.

Concave Lens

Optical System

Optical systems are used to focus light. They are used to focus light. They are used to focus light.
