Cellular Response to the Genotoxic Insult Helmut Greim, Richard Albertini, 2015-11-09 Genotoxic carcinogens can lead to DNA mutations with the potential to cause cancer Typically a series of mutation events are needed before malignancy occurs so a single small exposure may not result in disease Also cells have an armoury of defence mechanisms which to a degree counter the effects of mutagens Distinguishing the point at which exposure to a carcinogen increases mutation rates beyond the background level is challenging In fact there is now general agreement that for genotoxic carcinogens no specific threshold can be identified However NOAELs No Observed Adverse Effect Levels may be used in the process of establishing a dose response relationship These denote the level of exposure at which there is no significant increase in adverse effects in the exposed population when compared to an appropriate control Such a scientifically defensible threshold allows us to propose health based exposure limits for genotoxic carcinogens This book describes the various cellular defence mechanisms individually and explains how they are regulated The processes covered include metabolic inactivation epigenetic regulation scavenging mechanisms DNA repair and apoptosis It also considers dose dependent threshold mechanisms of carcinogenesis and the rate limiting parameters Aimed at graduate level and above the book discusses the consequences of genotoxic evaluation and urges readers to question the idea that even low exposures present a cancer risk
