Physics Patrick N. McDermott, 2016-08-19 The Topics Every Medical Physicist Should Know Tutorials in Radiotherapy Physics Advanced Topics with Problems and Solutions covers selected advanced topics that are not thoroughly discussed in any of the standard medical physics texts The book brings together material from a large variety of sources avoiding the need for you to search through and digest the vast research literature The topics are mathematically developed from first principles using consistent notation Clear Derivations and In Depth Explanations The book offers insight into the physics of electron acceleration in linear accelerators and presents an introduction to the study of proton therapy It then describes the predominant method of clinical photon dose computation convolution and superposition dose calculation algorithms It also discusses the Boltzmann transport equation a potentially fast and accurate method of dose calculation that is an alternative to the Monte Carlo method This discussion considers Fermi Eyles theory which is widely used for electron dose calculations The book concludes with a step by step mathematical development of tumor control and normal tissue complication probability models Each chapter includes problems with solutions given in the back of the book Prepares You to Explore Cutting Edge Research This guide provides you with the foundation to read review articles on the topics It can be used for self study in graduate medical physics and physics residency programs or in vendor training for linacs and treatment planning systems

Laser Interaction with Heterogeneous Biological Tissue Kirill Kulikov, Tatiana Koshlan, 2018-06-27 This book introduces readers to the principles of laser interaction with biological cells and tissues with varying degrees of organization In addition to considering the problems of biomedical cell diagnostics and modeling the scattering of laser irradiation of blood cells for biological structures dermis epidermis vascular plexus it presents an analytic theory based on solving the wave equation for the electromagnetic field It discusses a range of mathematical modeling topics including optical characterization of biological tissue with large scale and small scale inhomogeneities in the layers heating blood vessels using laser irradiation on the outer surface of the skin and thermo chemical denaturation of biological structures based on the example of human skin In this second edition a new electrodynamic model of the interaction of laser radiation with blood cells is presented for the structure of cells and the in vitro prediction of optical properties The approach developed makes it possible to determine changes in cell size as well as modifications in their internal structures such as transformation and polymorphism nucleus scattering which is of interest for cytological studies The new model is subsequently used to calculate the size distribution function of irregular shape particles with a variety of forms and structures which allows a cytological analysis of the observed deviations from normal cells
