Multiscale Modelling of Concrete Shanaka Baduge, Priyan Mendis, Sadeep Thilakarathna, Vanissorn Vimonsatit, 2025-08-29 Multiscale Modelling of Concrete covers all things concrete including comprehensive discussions on this multi phase and multi scale material that is difficult to model and understand due to its heterogeneity. Thus knowing the properties and modeling concrete in different scales is essential to predict properties and fracture. Most of the research has been focused on meso scale or the methods available to model and predict micro scale properties are not linked to experimental methods so properties for microscale cannot be derived and it is onerous to validate such methods. Considering the above constraints the book covers different modelling techniques of scales of concrete: macro, meso, micro, nano and molecular level, characterizing mechanical properties and parameters required for modelling using macro and micro level experiments and linking these levels using analytical and numerical methods to upscale results from micro to the macro level. Covers the multiscale nature of concrete and different characteristics of concrete at macro, meso, micro, nano and atomic scales. Includes finite element modeling of concrete at different length scales and advanced constitutive models of concrete and its constituents from nano to macroscales. Surveys state of the art experimental techniques to obtain mechanical properties of concrete at various spatial scales. Includes numerical and analytical homogenization methods to upscale and predict the macroscopic behavior of concrete and advanced molecular dynamics simulations of concrete constituents at the atomic and nanoscale.

High-Rise Buildings under Multi-Hazard Environment Mingfeng Huang, 2016-08-15 This book discusses performance based seismic and wind resistant design for high rise building structures with a particular focus on establishing an integrated approach for performance based wind engineering which is currently less advanced than seismic engineering. This book also provides a state of the art review of numerous methodologies including computational fluid dynamics, CFD, extreme value analysis, structural optimization, vibration control, pushover analysis, response spectrum analysis, modal parameter identification for the assessment of the wind resistant and seismic performance of tall buildings in the design stage and actual tall buildings in use. Several new structural optimization methods including the augmented optimality criteria method have been developed and employed in the context of performance based design. This book is a valuable resource for students, researchers and engineers in the field of civil and structural engineering.
