environmental research has increased in scope and complexity in the last few decades from simple systems with a few
managed variables to complex ecosystems with many uncontrolled variables These issues encompass problems that are
inadequately addressed using the types of carefully controlled experiments that dominate past ecological research
Contemporary challenges facing ecologists include whole ecosystem responses to planned restoration activities and
ecosystem modifications as well as unplanned catastrophic events such as biological invasions natural disasters and global
climate changes Major perturbations implicated in large scale ecological alterations share important characteristics that
challenge traditional experimental design and statistical analyses These include Lack of randomization replication and
independence Multiple scales of spatial and temporal variability Complex interactions and system feedbacks In real world
ecology standard replicated designs are often neither practical nor feasible for large scale experiments yet ecologists
continue to cling to these same standard designs and related statistical analyses Case studies that fully elucidate the
currently available techniques for conducting large scale unreplicated analyses are lacking Real World Ecology Large Scale
and Long Term Case Studies and Methods is the first to focus on case studies to demonstrate how ecologists can investigate
complex contemporary problems using new and powerful experimental approaches This collection of case studies showcases
innovative experimental designs analytical options and interpretation possibilities currently available to theoretical and
applied ecologists practitioners and biostatisticians By illustrating how scientists have answered pressing questions about
ecosystem restoration impact and recovery global warming conservation modeling and biological invasions this book will
broaden the acceptance and application of modern approaches by scientists and encourage further methodological
