Experimental Investigation of a Model of a Two-stage Turboblower S. Dovjik, W. Polikovsky, 1943 In the present paper an investigation is made of two stages of a multistage turboblower having a vaneless diffuser behind the impeller and guide vanes at the inlet to the next stage The method employed was that of investigating the performance of the successive elements of the blower the impeller vaneless diffuser etc whereby the kinematics of the flow through the blower could be followed and the pressure at the different points computed The character of the flow and the physical significance of the loss coefficients could thereby be determined so as to secure the best agreement of the computed with the actual performance of the blower Since the tests were carried out for various delivery volumes the dependence of the coefficients on a number of factors angle of attack velocities etc could be obtained The distribution of the losses that occur during the transformation of dynamic pressure at the impeller exit into static pressure could be found and likewise the range within which the friction coefficient varies in the vaneless diffuser With the aid of factors having a certain physical significance the centrifugal blower could be computed on the basis of a more or less schematical consideration of the phenomena occurring during the air flow through it and the use of arbitrary factors and recourse to the geometrical similitude law thus avoided The present investigation largely summarizes all the previous work of the CHI Blower Section on the different elements of a centrifugal blower Some considerations on the analysis of model test data for application to full scale are presented in the appendix Journal of Turbomachinery , **Russian Engineering Journal** , 1969 *Technical Memorandum - National Advisory Committee for Aeronautics* , 1942 Chiefly translations from foreign aeronautical journals
