Advanced Research in Nanosciences for Water Technology Ram Prasad, Thirugnanasambandham Karchiyappan, 2019-02-04 The establishment of clean safe water is one of the major challenges facing societies around the globe The continued urbanization of human populations the increasing manipulation of natural resources and the resulting pollution are driving remarkable burden on water resources Increasing demands for food energy and natural resources are expected to continue to accelerate in the near future in response to the demands of these changing human populations In

addition the complexity of human activities is leading to a diversity of new chemical contaminants in the environment that represent a major concern for water managers This will create increased pressure on both water quantity and quality making it increasingly difficult to provide a sustainable supply of water for human welfare and activities Although protection of water resources is the best long term solution we will also need innovative novel approaches and technologies to water treatment to ensure an adequate superior quality resource to meet these needs Solving tomorrow s water issues will require unique approaches that incorporate emerging new technologies Great advances have been made in the area of nanotechnology Due to their unique physical and chemical properties nanomaterials are extensively used in antibacterial medical products membrane filters electronics catalysts and biosensors Nanoparticles can have distinctly different properties from their bulk counterparts creating the opportunity for new materials with a diversity of applications Recent developments related to water treatment include the potential use of carbon nanotubes nanocompositae nanospheres nanofibers and nanowires for the removal of a diversity of chemical pollutants By exploiting the assets and structure of these new materials such as increased surface area high reactivity and photocatalytic action it will be possible to create technologies that can be very efficient at removing and degrading environmental pollutants Understanding and using these unique properties should lead to innovative cost effective applications for addressing the complexities of emerging needs for water treatment and protection Although still in the early stages research into the application of nanotechnology shows great promise for solving some of these major global water issues This comprehensive text describes the latest research and application methods in this rapidly advancing field
