

8.1 Numerical Methods

Numerical methods are used in solving complex numerical problems using only the simple operations of arithmetic. This also allows evaluation methods for computing numerical results from given data.

8.2 Solution of Equations

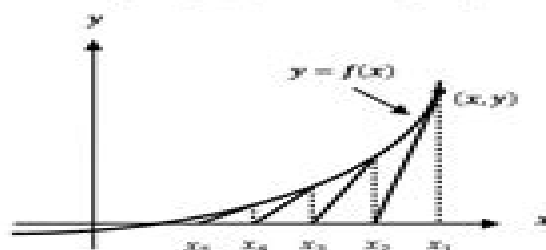

1. Newton's Method

Linear equations can be solved using the simple algebraic operations. Some equations such as quadratic equations can be solved using the quadratic formula. In case an equation, containing polynomials of higher degree or an equation involving transcendental functions, it is difficult and often impossible to obtain an exact solution. Such equations are,

$$x^3 + x = 4 \quad \text{and} \quad x^3 - 3x + 1 = 0$$

There are techniques for approximating solutions and one of them is the Newton's Method, also known as Newton-Raphson Method.

Consider a function $y = f(x)$ and its graph as shown below,

where x_1 is the first approximation, x_2 is the second, x_3 is the third and so on.

Newton's Method are based on,

1. If f is differentiable at x , then the tangent line at (x, y) , can be used to approximate the values of f near x .
2. The point where the tangent line crosses the x - axis is easy to determine.

Consider the first approximation x_1 . The tangent line at $(x_1, f(x_1))$ is,

$$y - f(x_1) = f'(x_1)(x - x_1)$$

Consider x_2 the point where the tangent line crosses the x - axis, when $x = x_2$ and $y = 0$, thus,
