Analog telecommunications uses continuous signals to transmit information, while digital telecommunications uses discrete binary signals (0s and 1s). Digital telecommunications offers higher quality, reliability, and efficiency compared to analog systems.

5. What is the significance of modulation in telecommunications?

Modulation is the process of encoding digital information onto an analog carrier signal for transmission. It allows digital data to be transmitted over analog mediums such as radio waves. Demodulation is the reverse process, extracting the original digital signal from the modulated carrier.

Cellular networks divide a geographic area into cells, each served by a base station. Mobile devices communicate with the nearest base station, which connects them to the telecommunications network. As a mobile device moves between cells, the network seamlessly hands off the connection to maintain continuity.

7. What is Voice over Internet Protocol (VoIP)?
