During the past century or so, the U.S. has experienced a dramatic increase in the number of people who are obese. In 1980, only 15% of the U.S. population was obese. By 2000, that number had risen to 30%. In 2008, the prevalence of obesity in the U.S. was 33.9% (Flegal et al., 2002). Obesity is a major risk factor for many chronic diseases, including heart disease, diabetes, and certain types of cancer. It is also associated with a higher risk of death from all causes. The causes of obesity are complex, involving a combination of genetic, environmental, and behavioral factors. The most common cause of obesity is a combination of eating too many calories and not getting enough exercise. Other factors that can contribute to obesity include genetics, hormones, and certain medications. Obesity is a preventable condition, and there are many ways to reduce the risk of becoming obese. These include eating a healthy diet, getting regular exercise, and avoiding sedentary activities. If you are obese, it is important to talk to your doctor about ways to lose weight and reduce your risk of complications.
