

Mitosis Worksheet

The diagram below shows six cells in various phases of the cell cycle. Note the cells are not arranged in the order in which mitosis occurs and one of the phases of mitosis occurs twice. Use the diagram to answer questions 1-7.

- 1) Cells A and F show an early and a late stage of the same phase of mitosis. What phase is it?
A - early prophase, F - late prophase
- 2) Which cell is in metaphase?
C
- 3) Which cell is in the first phase of mitosis?
A (if consider prophase 1st) but D (if consider interphase 1st)
- 4) In cell A, what structure is labeled X?
Centrioles
- 5) Which cell is in the "in between" phase of mitosis?
D (interphase, where the cell is being the cell it was created to be!)
- 6) Place the diagrams in order from first to last.
A, F, C, E, B, D (some may put D first. Remember this is a cycle so how the order is viewed is subjective)
- 7) Are the cells depicted plant or animal cells? Explain your answer.
Animal - round in shape
- 8) What is the longest phase of the cell cycle?
D
- 9) Why is mitosis important?
Allows cells to reproduce, making exact copies of themselves

radiosensitivity immunodeficiency and learning disability In addition recently discovered the ubiquitin receptor protein SPRTN is part of the DNA replication machinery and its mutations cause early onset hepatocellular carcinoma and premature ageing in humans Despite more than 700 different enzymes directly involved in ubiquitination and sumoylation processes only few of them are known to play a role in DDR Therefore we feel that the role of ubiquitin and the ubiquitin related SUMO in DDR is far from being understood and that this is the emerging field that will hugely expand in the next decade due to the rapid development of a new generation of technologies which will allow us a more robust and precise analyses of human genome transcriptome and proteome In this Research Topic we provide a comprehensive overview of our current understanding of ubiquitin and SUMO pathways in all aspects of DDR from DNA replication to different DNA repair pathways and demonstrate how alterations in these pathways cause genomic instability that is linked to degenerative diseases cancer and pathological ageing

Response Elahe Radmaneshfar,2013-10-08 The cell cycle is a sequence of biochemical events that are controlled by complex but robust molecular machinery This enables cells to achieve accurate self reproduction under a broad range of conditions Environmental changes are transmitted by molecular signaling networks which coordinate their actions with the cell cycle This work presents the first description of two complementary computational models describing the influence of osmotic stress on the entire cell cycle of *S cerevisiae* Our models condense a vast amount of experimental evidence on the interaction of the cell cycle network components with the osmotic stress pathway Importantly it is only by considering the entire cell cycle that we are able to make a series of novel predictions which emerge from the coupling between the molecular components of different cell cycle phases The model based predictions are supported by experiments in *S cerevisiae* and moreover have recently been observed in other eukaryotes Furthermore our models reveal the mechanisms that emerge as a result of the interaction between the cell cycle and stress response networks The Cell Cycle David Owen Morgan,2007
