

Biology II LAB Practical I

~Kingdom Protista~

Phylums:

Euglenophyta (Euglenids, trypanosoma-sleeping sickness)

Trypanosoma

- Trypanosomes evade immune responses with an effective "bait-to-switch" defense. The surface of a trypanosome is coated with millions of copies of a single protein. However, before the host's immune system can recognize the protein and mount an attack, new generations of the parasite switch to another surface protein with a different molecular structure. Frequent changes in the surface protein prevent the host from developing immunity.

Euglena

- Euglenid has a pocket at one end of the cell from which one or two flagella emerge. Many of the Euglena are mixotrophs: in sunlight they are autotrophic, but when sunlight is unavailable, they can become heterotrophic, absorbing organic nutrients from their environment.

Heterotrophic:

- An organism that cannot synthesize its own food and is dependent on complex organic substances for nutrition.

Autotrophic:

- An organism capable of making nutritive organic molecules from inorganic sources via photosynthesis (involving light energy) or chemosynthesis (involving chemical energy).
