The French School of Programming Bertrand Meyer, 2024-04-29 The French School of Programming is a collection of insightful discussions of programming and software engineering topics by some of the most prestigious names of French computer science The authors include several of the originators of such widely acclaimed inventions as abstract interpretation the Caml OCaml and Eiffel programming languages the Coq proof assistant agents and modern testing techniques The book is divided into four parts Software Engineering A Programming Language Mechanisms and Type Systems B Theory C and Language Design and Programming Methodology D They are preceded by a Foreword by Bertrand Meyer the editor of the volume a Preface by Jim Woodcock providing an outsider's appraisal of the French school's contribution and an overview chapter by Gérard Berry recalling his own intellectual journey Chapter 2 by Marie Claude Gaudel presents a 30 year perspective on the evolution of testing starting with her own seminal work In chapter 3 Michel Raynal covers distributed computing with an emphasis on simplicity Chapter 4 by Jean Marc Jézouel former director of IRISA presents the evolution of modeling from CASE tools to SLE and Machine Learning Chapter 5 by Joëlle Coutaz is a comprehensive review of the evolution of Human Computer Interaction In part B chapter 6 by Jean Pierre Briot describes the sequence of abstractions that led to the concept of agent Chapter 7 by Pierre Louis Curien is a personal account of a journey through fundamental concepts of semantics syntax and types In chapter 8 Thierry Coquand presents some remarks on dependent type theory Part C begins with Patrick Cousot's personal historical perspective on his well known creation abstract interpretation in chapter 9 Chapter 10 by Jean Jacques Levy is devoted to tracking redexes in the Lambda Calculus The final chapter of that part chapter 11 by Jean Pierre Jouannaud presents advances in rewriting systems specifically the confluence of terminating rewriting computations Part D contains two longer contributions Chapter 12 is a review by Giuseppe Castagna of a broad range of programming topics relying on union intersection and negation types In the final chapter Bertrand Meyer covers ten choices in language design for object oriented programming distinguishing between right and wrong resolutions of these issues and explaining the rationale behind Eiffel's decisions This book will be of special

interest to anyone with an interest in modern views of programming on such topics as programming language design the relationship between programming and type theory object oriented principles distributed systems testing techniques rewriting systems human computer interaction software verification and in the insights of a brilliant group of innovators in the field **El-Hi Textbooks & Serials in Print, 2003** ,2003 *Low-Power High-Resolution Analog to Digital Converters* Amir Zjajo, José Pineda de Gyvez, 2010-10-29 With the fast advancement of CMOS fabrication technology more and more signal processing functions are implemented in the digital domain for a lower cost lower power consumption higher yield and higher re configurability This has recently generated a great demand for low power low voltage A D converters that can be realized in a mainstream deep submicron CMOS technology However the discrepancies between lithography wavelengths and circuit feature sizes are increasing Lower power supply voltages significantly reduce noise margins and increase variations in process device and design parameters Consequently it is steadily more difficult to control the fabrication process precisely enough to maintain uniformity The inherent randomness of materials used in fabrication at nanoscopic scales means that performance will be increasingly variable not only from die to die but also within each individual die Parametric variability will be compounded by degradation in nanoscale integrated circuits resulting in instability of parameters over time eventually leading to the development of faults Process variation cannot be solved by improving manufacturing tolerances variability must be reduced by new device technology or managed by design in order for scaling to continue Similarly within die performance variation also imposes new challenges for test methods In an attempt to address these issues Low Power High Resolution Analog to Digital Converters specifically focus on i improving the power efficiency for the high speed and low spurious spectral A D conversion performance by exploring the potential of low voltage analog design and calibration techniques respectively and ii development of circuit techniques and algorithms to enhance testing and debugging potential to detect errors dynamically to isolate and confine faults and to recover errors continuously The feasibility of the described methods has been verified by measurements from the silicon prototypes fabricated in standard 180nm 90nm and 65nm CMOS technology
