108 Structure of the Mammalian Heart

Key ideas: Mammals have a four-chambered heart, divided into left and right halves, and acting as a double pump. The heart is the centre of the human circulatory system. It is a hollow, muscular organ made up of four chambers (two atria and two ventricles) that alternately fill and empty of blood, acting as a double pump. The left side pumps the oxygenated blood to the rest of the body, and the right side pumps deoxygenated blood to the lungs.

The heart is not a spherical organ. Although the quantity of blood pumped by each side is the same, the walls of the two ventricles are shaped so that the left ventricle has a thicker wall than the right ventricle to enable it to pump blood to the rest of the body.

- 1. Right atrium: receives deoxygenated blood in the anterior and posterior vena cavae
- 2. Right ventricle: pumps deoxygenated blood to the lungs via the pulmonary artery
- 3. Left atrium: receives oxygenated blood returning to the heart from the lungs via the pulmonary veins
- 4. Left ventricle: pumps oxygenated blood to the rest of the body via the aorta

1. In the schematic diagram of the heart below, label the four chambers and the main vessels entering and leaving them. Then complete the diagram of blood flow, using large coloured circles to mark the direction of flow of the blood.

Each activity has a key idea summarizing its primary focus. It helps students to understand where the activity's emphasis lies.
