Vickers,1966 To determine optimal cloud seeding techniques and optimal design specifications for a dry ice seeding machine the Cloudbuster multiple strip seeding of stratiform decks was performed during which seeding rate pellet size and strip orientation with respect to wind were systematically changed from strip to strip Concurrently the physical properties of the cloud decks were measured and cloud response i e hole size growth rate etc to the varying treatments was measured photogrammetrically Results showed that both the dry ice seeding rate and pellet size as well as the cloud temperature exerted a strong influence on cloud response Seeding rate had an optimum of 8 9 lb naut mile of CO2 pellets whereafter additional quantities no longer influenced the experiment predictably Generally clouds failed to respond to treatment at 1 8 lb naut mile A minimum recommended quantity of CO2 pellets is 4 lb naut mile using a 1 x 1 x 1 cm pellet of 0 5 g cc density This CO2 pellet has a fall distance of 1200 ft When combined with other machine functions this seeding rate and pellet size allow an output of 10 500 pellets naut mile Cloud response approximately doubles between 5 C and 11 C A response failure point exists between 3 C and 4 C Strips should be seeded about 40 min worth of drift upwind of the desired location and should be seeded across the wind Seeding altitude for the aircraft should be coincident with the top of the deck for all but thickest decks 1200 ft Author **Research Report** ,1959 U.S. Environmental Protection Agency Library System Book Catalog, Holdings for the Year United States.
