applications *Appropriate Technologies for Environmental Protection in the Developing World* Ernest K. Yanful, 2009-02-19 This book is the first edited compilation of selected refereed papers submitted to ERTEP 2007. The selected papers either dealt with technologies or scientific work and policy findings that address specific environmental problems affecting humanity in general but more specifically people and ecosystems in developing countries. It was not necessary for the work to have been done in a developing country but the findings and results must be appropriate or applicable to a developing country setting. It is acknowledged that environmental research technology applications and policy implementation have been demonstrated to improve environmental sustainability and protection in several developed economies. The main argument of the book is that similar gains can be achieved in developing economies and economies in transition. The book is organized into six chapters along some of the key themes discussed at the conference: Environmental Health Management, Sustainable Energy and Fuel Water Treatment, Purification and Protection, Mining and Environment, Soil Stabilization and Environmental Monitoring. It is hoped that the contents of the book will provide an insight into some of the environmental and health management challenges confronting the developing world and the steps being taken to address them.

Introduction to Classical Mechanics Jain, Pushpendra K., Nkoma, John S., 2019-05-22 This book introduces Tanzanian students to the fascinating world of Mechanics, the science of motion and equilibrium. Concepts of mechanics, namely vector and scalar quantities, forces, the laws of motion, work, energy, the conservation laws, gravitation, circular, orbital and oscillatory motions, cut across not only most branches of physics such as electromagnetism, atomic, molecular, nuclear, astro and space physics but are also applied to most branches of engineering and technology. This makes mechanics an important component of physics which students must master well at an early stage before branching to various career options. That is why undergraduate programs in sciences at most universities offer mandatory courses on basic mechanics within the first year of study. This book meets the needs of students and academics at the entry level courses. This book covers three crucial subareas of mechanics, namely Kinematics, Newtonian mechanics and Lagrangian mechanics. Chapter 1 covers introductory aspects. Kinematics is discussed in chapter 2. Newton's laws of motion are introduced in chapter 3. Chapter 4 deals with the conservation of linear momentum. Work, energy and power are covered in chapter 5. Circular motion, Gravitation and planetary motion and oscillations are covered in chapters 6, 7 and 8 respectively. Chapter 9 presents the aspects of rigid body dynamics and Lagrangian mechanics is introduced in chapter 10 which lays a foundation for advanced courses in mechanics. The language of physics is universal and the book is suited to students globally. However, the book recognises and addresses the specific needs of students in African Universities. There is a marked heterogeneity in the background of students ranging from those who are well prepared to those who are not so well prepared. The book meets the needs of all students. It presents detailed explanations of difficult topics with the help of simple but clearly drawn and labeled diagrams. The discussions and conclusions are presented point wise and key words, definitions, laws etc are highlighted. A unique feature of the book is a number of Recipes which give

students tailor made guidance to problems solving Application of the recipe is illustrated by a solved example followed by a similar exercise for students to practice There are a large number of problems and exercises at the end of each chapter to further sharpen their skills
