

Experimental Probability

Experimental probability is the probability of an event happening based on an actual experiment or observation.

To calculate the **experimental probability** of an event, we find the relative frequency of the event.

$$\text{Relative frequency} = \frac{\text{frequency of event occurring}}{\text{total number of trials of the experiment}}$$

We can also express this as $R = \frac{f}{n}$ where R is the relative frequency, f is the frequency of the event occurring, and n is the number of trials of the experiment.

If we find the relative frequency for all possible outcomes from the experiment we can write the probability distribution for that experiment.
