

Sequences

Sequences (numerical patterns) are sets of numbers that follow a particular pattern or rule to get from number to number. Each number is called a term in a pattern.

An **arithmetic sequence** is a number pattern where the rule is **addition** or **subtraction**.

 Example

Rule: Add 5 each time

An **geometric sequence** is a number pattern where the rule is **multiplication** or **division**.

 Example

Rule: Divide the previous term by 2

Comprehensive Guide to IBPS RRB Officers Scale II & III Exams 2020 Disha Experts, 2020-07-15 **Number Mosaics**
Adi R. Kanga, 1995 Number Mosaics has little in common with most other books of recreational mathematics Though it contains much for the reader to marvel at and wonder about it is far from being just another book of mind bending puzzles It is more in the nature of a story of discovery and adventure in hitherto unexplored regions of the fascinating universe of numbers and patterns As the story unfolds the reader is drawn into it and soon becomes a member of the exploring party The problems which feature in the book are intriguing in themselves but the focus is not so much on obtaining the right answers as on the numerous and ingenious ways of arriving at the solutions The approach adopted is similar to that often used in the past by old masters like Fermat Euler and Gauss to name a few The critical examination of raw data initially invokes a response in the form of a conjecture which is then refined and tested in wider and wider fields The book abounds with illustrative examples and illuminating diagrams and throughout it the search for universals continues like a powerful undercurrent as master keys are forged which work under all manner of changing conditions for solving a variety of problems often without the need for calculations This is a book which lovers of number lore will surely relish

Function Theory and Operator Theory held virtually on April 6 2022 Function theory is a classical subject that examines the properties of individual elements in a function space while operator theory usually deals with concrete operators acting on such spaces or other structured collections of functions These topics occupy a central position in analysis with important connections to partial differential equations spectral theory approximation theory and several complex variables With the aid of certain canonical representations or models the study of general operators can often be reduced to that of the operator of multiplication by one or several independent variables acting on spaces of analytic functions or compressions of this operator to co invariant subspaces In this way a detailed understanding of operators becomes connected with natural questions concerning analytic functions such as zero sets constructions of functions constrained by norms or interpolation multiplicative structures granted by factorizations in spaces of analytic functions and so forth In many cases non obvious problems initially motivated by operator theoretic considerations turn out to be interesting on their own leading to unexpected challenges in function theory The research papers in this volume deal with the interplay between function theory and operator theory and the way in which they influence each other
