

# Experimental Probability

**Experimental probability** is the probability of an event happening based on an actual experiment or observation.

To calculate the **experimental probability** of an event, we find the relative frequency of the event.

$$\text{Relative frequency} = \frac{\text{frequency of event occurring}}{\text{total number of trials of the experiment}}$$

We can also express this as  $R = \frac{f}{n}$  where  $R$  is the relative frequency,  $f$  is the frequency of the event occurring, and  $n$  is the number of trials of the experiment.

If we find the relative frequency for all possible outcomes from the experiment we can write the probability distribution for that experiment.
