

gene regulation

I. Prokaryotic Gene Regulation

constitutive genes = always needed + constantly transcribed
other genes are only transcribed when needed

A. Lac Operon Model

in prokaryotes genes are regulated at transcription

3 genes for lactose metabolism in E.coli on *DNA*:

1. lac Z
2. lac Y
3. lac A

if no lactose - cell does NOT make these enzymes

if lactose is present - enzymes are made

e.coli prefers glucose to lactose

only metabolizes lactose if there is no/very little glucose

operon = a group of genes controlled by a single regulatory signal → controlled by an **operator**

ONLY IN PROKARYOTES

transcribed together

operon = sequence of DNA with:

1. **promoter**
2. **operator** - switch on 'DNA'
3. **structural genes**

promoter and **operator** re binding sites on DNA - not transcribed

inducible gene(lac operon)

usually off; transcription need to be turned on

a repressor is bound to operator

to turn on - **an inducer** molecule inactivates the repressor

2 ways of regulating an operon:

1. negative regulation - **repressor** prevents transcription(repressor acts like a car break)
2. positive regulation - transcribed, but.....only a little(pressing on the accelerator)
