Space - Time - Matter Jochen Brüning, Matthias Staudacher, 2018-04-09 This monograph describes some of the most interesting results obtained by the mathematicians and physicists collaborating in the CRC 647 Space Time Matter in the years 2005-2016. The work presented concerns the mathematical and physical foundations of string and quantum field theory as well as cosmology. Important topics are the spaces and metrics modelling the geometry of matter and the evolution of these geometries. The partial differential equations governing such structures and their singularities, special solutions and stability properties are discussed in detail. Contents: Introduction, Algebraic K-theory, assembly maps, controlled algebra and trace methods, Lorentzian manifolds with special holonomy, Constructions and global properties, Contributions to the spectral geometry of locally homogeneous spaces, On conformally covariant differential operators and spectral theory of the holographic Laplacian, Moduli and deformations, Vector bundles in algebraic geometry and mathematical physics, Dyson-Schwinger equations, Fix point equations for quantum fields, Hidden structure in the form factors of $N=4$ SYM, On regulating the AdS superstring, Constraints on CFT observables from the bootstrap program, Simplifying amplitudes in Maxwell-Einstein and Yang-Mills-Einstein supergravities, Yangian symmetry in maximally supersymmetric Yang-Mills theory, Wave and Dirac equations on manifolds, Geometric analysis on singular spaces, Singularities and long time behavior in nonlinear evolution equations and general relativity.

Landscape of 21st Century Mathematics Bogdan Grechuk, 2021-09-21 Landscape of 21st Century Mathematics offers a detailed cross-section of contemporary mathematics. Important results of the 21st century are motivated and formulated, providing an overview of recent progress in the discipline. The theorems presented in this book have been selected among recent achievements whose statements can be fully appreciated without extensive background. Grouped by subject, the selected theorems represent all major areas of mathematics: number theory, combinatorics, analysis, algebra, geometry and topology, probability and statistics, algorithms and complexity, and logic and set theory. The presentation is self-contained, with context, background, and necessary definitions provided for each theorem, all without sacrificing mathematical rigour. Where feasible, brief indications of the main ideas of a proof are given. Rigorous yet accessible, this book presents an array of breathtaking recent advances in mathematics. It is written for everyone with a background in mathematics, from inquisitive university students to mathematicians curious about recent achievements in areas beyond their own.

Progress in Mathematical Fluid Dynamics Tristan Buckmaster, Sunčica Čanić, Peter Constantin, Alexander A. Kiselev, 2020-09-28 This volume brings together four contributions to mathematical fluid mechanics, a classical but still highly active research field. The contributions cover not only the classical Navier-Stokes equations and Euler equations but also some simplified models and fluids interacting with elastic walls. The questions addressed in the lectures range from the basic problems of existence, blow-up of weak and more regular solutions to modeling and aspects related to numerical methods. This book covers recent advances in several important areas of fluid mechanics. An output of the CIME Summer School.
