My research consists of the processing of signals from the 14 electrodes of the EMOTIV system connected to immersive glasses that allow a realistic visual experience and investigate the brain network in order to identify the signals features corresponding to different perceptive and cognitive stimuli. A Matlab Simulink procedure synchronizes the acquired signals with various sensory experiences presented in a video. Aim of the research is to test the interconnections among brain areas in presence of sensory and emotional stimuli and show how similar stimuli give rise to chaotic attractors identified with identical or similar codes. The chaotic attractors can be defined as a trajectory of the dynamical system contained in a finite volume of phase space. A dynamical system can have chaotic behavior i.e. an organized but not periodic behaviour sensitive to the initial conditions. In this work a custom ANN ITSOM processes individual signals or many signals simultaneously. The sequence of the ITSOM winning nodes tends to repeat itself creating a time series of chaotic attractors. The ITSOM attributes similar codes to attractors emerging from similar brain states, perceptions and emotions. Such attractors are isomorphic to the attractors in which the corresponding dynamic system the signal time series is evolving and characterize univocally the input element that produces them. If the attractors are chaotic this means that the signals are individually self organized or examining more signals together there is a form of coherence between signals *Degenerative Cervical Myelopathy* Michael G.
