

THE SKELETON
The skeleton is the framework of the body, supporting the soft organs and tissues. It is composed of bones and cartilage. The bones are made of a hard, white, mineralized substance called bone tissue. The cartilage is a soft, white, jelly-like substance. The skeleton is divided into the axial skeleton (skull, spine, and rib cage) and the appendicular skeleton (arms and legs).

THE MUSCLES
The muscles are the soft tissue that contracts to move the bones. They are made of muscle fibers. The muscles are divided into the skeletal muscles (attached to bones) and the smooth muscles (not attached to bones). The skeletal muscles are voluntary muscles, meaning they can be controlled by the conscious mind. The smooth muscles are involuntary muscles, meaning they cannot be controlled by the conscious mind.

THE JOINTS
The joints are the points where two or more bones meet. They allow the bones to move relative to each other. There are three main types of joints: fibrous joints, cartilaginous joints, and synovial joints. Fibrous joints are the least movable, cartilaginous joints are slightly more movable, and synovial joints are the most movable.

THE NERVOUS SYSTEM
The nervous system is the control system of the body. It is composed of the brain, spinal cord, and nerves. The brain is the central control center, the spinal cord is the main communication line, and the nerves are the branches that carry messages to and from the rest of the body. The nervous system is divided into the central nervous system (brain and spinal cord) and the peripheral nervous system (nerves).

THE CIRCULATORY SYSTEM
The circulatory system is the system that transports blood throughout the body. It is composed of the heart, blood vessels, and blood. The heart is the pump that moves the blood, the blood vessels are the pipes that carry the blood, and the blood is the fluid that carries the oxygen and nutrients. The circulatory system is divided into the systemic circulation (carries blood to and from the rest of the body) and the pulmonary circulation (carries blood to and from the lungs).

THE DIGESTIVE SYSTEM
The digestive system is the system that breaks down food into nutrients that the body can use. It is composed of the mouth, esophagus, stomach, small intestine, large intestine, and rectum. The mouth is where food is taken in, the esophagus is where food goes to the stomach, the stomach is where food is broken down, the small intestine is where nutrients are absorbed, the large intestine is where water is absorbed, and the rectum is where waste is eliminated.

THE RESPIRATORY SYSTEM
The respiratory system is the system that takes in oxygen and removes carbon dioxide from the body. It is composed of the nose, mouth, trachea, bronchi, and lungs. The nose and mouth are where air enters the body, the trachea and bronchi are the airways, and the lungs are where gas exchange occurs.

THE EXCRETORY SYSTEM
The excretory system is the system that removes waste from the body. It is composed of the kidneys, ureters, bladder, and urethra. The kidneys are the organs that filter waste from the blood, the ureters are the pipes that carry waste to the bladder, the bladder is where waste is stored, and the urethra is where waste is eliminated.

THE ENDOCRINE SYSTEM
The endocrine system is the system that produces hormones. It is composed of the hypothalamus, pituitary gland, thyroid gland, parathyroid glands, and adrenal glands. The hypothalamus and pituitary gland are the master glands, the thyroid and parathyroid glands are the endocrine glands, and the adrenal glands are the glands that sit on top of the kidneys.
