

The Digestive System

What is the digestive system?

The digestive system, or **gastrointestinal tract**, is a tract of organs that is responsible for digesting and absorbing nutrients from food. Food is broken down mechanically in the mouth, is digested through a series of chemical reactions, and absorbed into the bloodstream. The nutrients are then used by the body for energy and growth. The digestive system also plays a role in the elimination of waste from the body.

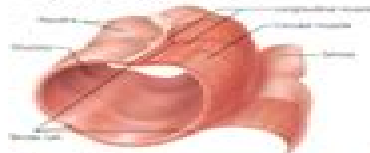

Liver, pancreas & gallbladder

After leaving the stomach, chyme moves into the duodenum, the first part of the small intestine, where it is mixed with bile secreted by the **liver** and pancreatic juice secreted by the **pancreas**. This area is a mixing region on the intestine where the duodenum opens into the descending duodenum. The liver and pancreas secrete bile and pancreatic juice into the duodenum.

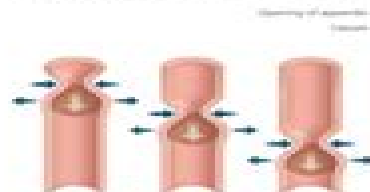

Layers of large intestine

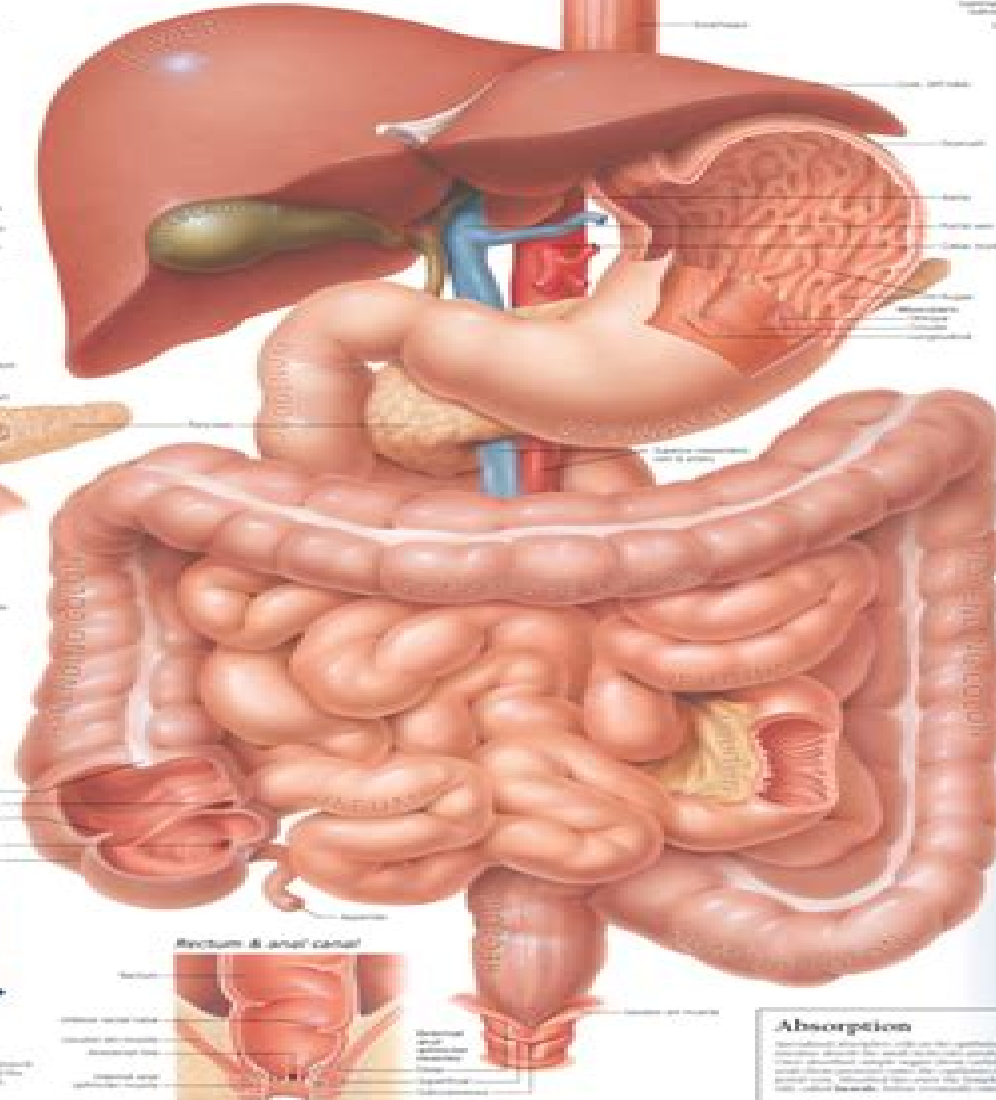

Large intestine

The large intestine consists of the cecum, the colon, and the rectum. The cecum is the first part of the large intestine, where it receives chyme from the small intestine. The colon is the main part of the large intestine, where most of the water and electrolyte absorption occurs. The rectum is the final part of the large intestine, where the feces are stored before being eliminated from the body.

Peristaltic action

Food material is pushed through the digestive system by a series of powerful muscular contractions called peristalsis. These contractions move the material forward and the food is then, when the stomach has relaxed.

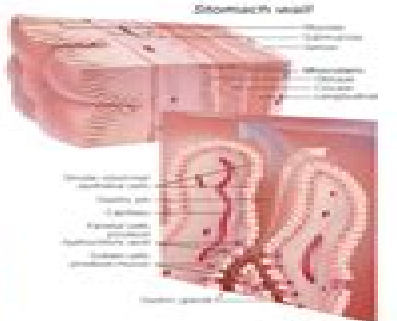

The mouth & salivary glands

Chewing the food breaks it into smaller pieces, making it easier to swallow. Saliva, secreted by the salivary glands, moistens the food and helps in the digestion of carbohydrates. The salivary glands are located in the mouth and secrete saliva into the mouth through salivary ducts.

The stomach

The stomach is a large, muscular organ that is responsible for the digestion of food. It receives food from the esophagus and mixes it with gastric juice, which contains hydrochloric acid and pepsin. The stomach wall is composed of several layers of muscle, which contract to mix the food and move it forward into the small intestine.

Small intestine

The small intestine is a long, coiled tube that is responsible for the digestion of food. It receives chyme from the stomach and mixes it with pancreatic juice and bile. The small intestine is divided into three parts: the duodenum, the jejunum, and the ileum. The duodenum is the first part, where most of the digestion occurs. The jejunum is the middle part, where most of the absorption occurs. The ileum is the last part, where the remaining nutrients are absorbed.

Absorption

The nutrients from the food are absorbed into the bloodstream through the walls of the small intestine. The villi on the inner surface of the small intestine increase the surface area for absorption. The nutrients are then transported to the liver through the portal vein.
