Anatomy and Physiology explores the essentials of human structure and function through engaging, generously illustrated, full color activities. Each body system is explored in detail. Homeostasis provides a unifying theme connecting the body systems and highlighting their interrelatedness. Students are encouraged to explore each body system within the contexts of four themes: disease, medicine and technology, aging, and exercise. The result is a rounded exploration of human anatomy and physiology.

BIOZONE's unique, interactive worktext approach encourages direct interaction with the content, allowing students to record their answers within the context of the stimulus material and form a record of work for quick and easy revision.

108 Structure of the Mammalian Heart

Key ideas: Mammals have a four-chambered heart, divided into left and right halves, and acting as a double pump. The heart is the centre of the human circulatory system. It is a hollow, muscular organ made up of four chambers (two atria and two ventricles) that alternately fill and empty of blood, acting as a double pump. The left side pumps the oxygenated blood to the rest of the body, and the right side pumps deoxygenated blood to the lungs. The heart has a double-layered pericardium of connective tissue, which prevents over-distension of the heart and anchors it within the mediastinal compartment of the thoracic cavity.

Human heart structure (simplified, anterior view)

Arrows indicate oxygenated blood in the heart and body. Blood enters the heart from the right atrium. Deoxygenated blood enters the right atrium. Deoxygenated blood enters the right ventricle. Oxygenated blood enters the left atrium. Oxygenated blood enters the left ventricle. The heart is not a symmetrical organ. Although the majority of blood pumped by each side is to the rest of the body, the volume of the left ventricle is double that of the right ventricle. The left ventricle is thicker-walled than the right ventricle.
