The knee is a **Bicondylar type Synovial Hinge** joint formed between the distal ends of the Femur and the proximal ends of the Tibia with the **Patella** (Kneecap) in front of the Femur. A smooth, protective layer of **Hyaline Cartilage** coats the bone surfaces. Between the bones a crescent shaped pad of tough, **Fibrocartilage** (Meniscus) provides a smooth surface for movement and absorbs shocks. Surrounding the joint, connective tissue called the **Synovial Membrane** secretes lubricating **Synovial Fluid**. Strong **Cruciate Ligaments** in an "X" configuration stabilise and limit joint movement. The **Patella**'s function is to add knee extension by enhancing **Quadriceps Tendon** mechanical leverage and to protect the anterior aspect of the joint. **Joint Extension** is enabled by the **Tensor Fasciae Latae** and **Quadriceps Femoris** (**Rectus Femoris**, **Vastus Lateralis**, **Vastus Medialis**, **Vastus Intermedius**) and **Flexion** by the **Hamstrings** (**Semitendinosus**, **Semimembranosus**, **Biceps Femoris**). Limited lateral rotation is enabled by **Biceps Femoris** and limited Medial rotation by **Semitendinosus**, **Semitendinosus**, **Gracilis**, **Sartorius** and **Popliteus**.

Maquet,2012-12-06 Pathological conditions affecting the hip and knee joints occupy a particular place amongst the important orthopaedic entities affecting the extremities On the one hand they are relatively frequent and on the other they mean for the patient limitation of his ability to walk because of their considerably detrimental effects A purposeful basic treatment of these joint diseases and here osteoarthritis takes pride of place is only possible if it stems from a reliable biomechanical analysis of the normal and pathological stressing of the joint in question Whilst the situation in the hip can be considered to be fundamentally clarified a comprehensive representation of the knee is still lacking particularly when taking into account the latest knowledge of biomechanics Recently our concepts of the kinematics of the knee have been completely changed but the clinically important question of articular stressing remains unanswered Dr Maquet has carried out pioneer work in this field for some years in adapting by analogy to the knee joint principles already accepted for the hip joint Since the knee is not a ball and socket joint a complicated problem arises for which new thoughts are necessary The results of the numerous operations carried out by Dr Maquet according to the biomechanical considerations demonstrate that his thinking is fundamentally correct Above all it is here again proven as earlier in the case of the hip that healing of osteoarthritis depends decisively on reducing and evenly distributing joint pressure **Catalog, Educational Motion Pictures** ,1961 **National Library of Medicine News** National Library of Medicine (U.S.),1986 **Circular** United States.
