

Immune Part Pathophysiology Case Studies – Answer Key

Scenario 1:

D.W. is a 25-year-old married woman with three children under 5 years old. She came to her physician 7 months ago with vague complaints of intermittent fatigue, joint pain, low-grade fever, and unintentional weight loss. Her physician noted small, patchy areas of vitiligo and a scaly rash across her nose, cheeks, back, and chest at that time. Laboratory studies revealed that D.W. had a positive antinuclear antibody (ANA) titer, positive anti-dsDNA test, positive anti-Sm test, elevated C-reactive protein (CRP) and erythrocyte sedimentation rate (ESR), and decreased C3 and C4 serum complement. Joint x-ray films demonstrated joint swelling without joint erosion. D.W. was diagnosed with systemic lupus erythematosus (SLE). Her initial treatment consisted of hydroxychloroquine (Plaquenil) 400mg and prednisone (Deltasone) 20 mg orally per day, bed rest, and ice packs. D.W. responded well and the steroid was tapered and discontinued. She was told she could report for follow-up every 6 months unless her symptoms became acute. D.W. resumed her job in environmental services at a large geriatric facility.

1. What is the significance of each of D.W.'s laboratory findings?

- Positive ANA:** most sensitive test for lupus (screening) - 90% of all SLE patients will be positive.
- Positive anti-dsDNA & positive anti-Sm:** the most specific to SLE
- Elevated CRP & ESR and decreased C3 and C4:** nonspecific markers of inflammatory processes in the body. She has an active inflammatory process.

2. What priority problems would be addressed in D.W.'s care plan at that time of diagnosis?

- Education about the disease process, treatments, possible complications, recognizing signs of exacerbations, measures to reduce risk of infection, importance of good nutrition and stress reduction, and how to limit rash eruption.

28 mos after dx, D.W. seeks out her physician with complaints of puffy hands and feet and increased fatigue. D.W. reports that she has been working longer hours because of the absence of two of her fellow workers.

3. Which laboratory findings concern you, and why?

- Her BUN & creatinine are slightly elevated; she is slightly hyponatremic, and her urine should not have protein or red blood cells (RBCs). These are all consistent with the likelihood of D.W. having developed glomerulonephritis secondary to SLE. Immune complexes are formed against connective tissues that are eliminated through the kidneys; the immune complexes are too large to be filtered and thus collect within the glomerulus, eventually destroying the basement membrane. As the process continues, D.W. is at risk for developing end-stage renal disease.

Scenario 2:

You are working in a community health clinic and you have just taken C.Q., a 38-year-old woman, into the consultation room. C.Q. has been divorced for 5 years, has two daughters (ages 14 and 16), and works full time as a legal secretary. She is here for her yearly routine physical examination. C.Q. states she is in a serious relationship, is contemplating marriage, and just wants to make certain she is "okay." No abnormalities were noted during C.Q.'s physical examination. Blood was drawn for routine blood chemistries and hematology studies; since she has never been tested, C.Q. agrees to a human immunodeficiency virus (HIV) test. The physician requests you perform a rapid HIV test, which is an antibody test. Within 20 minutes, the results are available and are positive.

1. What counseling do you need to provide to C.Q.? Could this be a false positive?

2.

- You need to explain the meaning of the rapid test result in simple terms, avoiding technical jargon.
- Emphasize the importance of having confirmatory testing and that you need to draw another blood sample. Go ahead and schedule a return visit for the confirmatory test results. Tell her that it is important she take precautions to avoid possibly transmitting the infection to others while awaiting results of confirmatory testing. A simple message to convey this information could be, "Your preliminary test result is positive, but we won't know for sure if you are infected with HIV until we get the results from your confirmatory test. In the meantime, you should take precautions to avoid transmitting the virus." Then review measures to decrease the risk of HIV transmission, including use of a condom with her partner during anal and vaginal intercourse.

3. C.Q. assumes or believes (1) her partner is HIV positive; (2) he intentionally withheld the information from her; and (3) he intentionally transmitted the HIV to her through unprotected sex. Based on your knowledge of HIV infection, how would you counsel C.Q.?

- First, ask C.Q. whether she received a blood transfusion between 1978 and 1985; underwent dental work or surgery or sustained trauma within the past several years; used a needle to inject drugs or medications into her body (even once); got tattoos; or if she and her partner are currently using condoms during intercourse.
- Suggest that C.Q. talk to j. about undergoing HIV testing; there is a possibility that j. is not infected or that he is unaware that he has the HIV infection.
- Have C.Q. make an appointment with an HIV specialist to talk about her disease and undergo further testing and workup.
