Coloring of Plastics Robert A. Charvat, 2005-02-25 Expert coverage of the state of the art in plastics coloring This latest edition of Coloring of Plastics Fundamentals offers an updated introduction to color as a science while also providing the foundation for many additional technological subjects The basic families of colorants are described along with their properties The material examines how statistical analysis can improve the consistency of colored polymer production runs as well as the colorants used to match the color Other important topics covered in Coloring of Plastics Fundamentals Second Edition include Environmental issues and the reuse of discarded material Potential problems with the interaction between colorants and other additives Measurement information and matching visually and instrumentally Techniques for incorporating colorants into polymers as compounds or concentrates Special effect colorants Polymer and colorant manufacturers plastics compounders and coating and synthetic fiber industries will acquire an enhanced appreciation of the complex technological issues a colorist must consider if a plastics coloring project is to succeed *Conference on Effects of Radiation on Dielectric Materials* Naval Research Laboratory (U.S.), 1955 *Mathematical Foundations of Computer Science 2000* Mogens Nielsen, Branislav Rován, 2003-06-29 This book constitutes the refereed proceedings of the 25th International Symposium on Mathematical Foundations of Computer Science MFCS 2000 held in Bratislava Slovakia in August September 2000 The 57 revised full papers presented together with eight invited papers were carefully reviewed and selected from a total of 147 submissions The book gives an excellent overview on current research in theoretical informatics All relevant foundational issues from mathematical logics as well as from discrete mathematics are covered Anybody interested in theoretical computer science or the theory of computing will benefit from this book Combinatorial Optimization and Applications Weifan Wang, Xuding Zhu, Ding-Zhu Du, 2011-07-30 This book constitutes the refereed proceedings of the 5th International Conference on Combinatorial Optimization and Applications COCOA 2011 held in Zhangjiajie China in August 2011 The 43 revised full papers were carefully reviewed and selected from 65 submissions The papers cover a broad range of topics in combinatorial optimization and applications focussing on experimental and applied research of general algorithmic interest and research motivated by real world problems *Distributed Graph Coloring* Leonid Barenboim, Michael Elkin, 2022-06-01 The focus of this monograph is on symmetry breaking problems in the message passing model of distributed computing In this model a communication network is represented by a n vertex graph $G(V, E)$ whose vertices host autonomous processors The processors communicate over the edges of G in discrete rounds The goal is to devise algorithms that use as few rounds as possible A typical symmetry breaking problem is the problem of graph coloring Denote by the maximum degree of G While coloring G with 1 colors is trivial in the centralized setting the problem becomes much more challenging in the distributed one One can also compromise on the number of colors if this allows for more efficient algorithms Other typical symmetry breaking problems are the problems of computing a maximal independent set MIS and a

maximal matching MM The study of these problems dates back to the very early days of distributed computing The founding fathers of distributed computing laid firm foundations for the area of distributed symmetry breaking already in the eighties In particular they showed that all these problems can be solved in randomized logarithmic time Also Linial showed that an $O(2)$ coloring can be solved very efficiently deterministically However fundamental questions were left open for decades In particular it is not known if the MIS or the 1 coloring can be solved in deterministic polylogarithmic time Moreover until recently it was not known if in deterministic polylogarithmic time one can color a graph with significantly fewer than 2 colors Additionally it was open and still open to some extent if one can have sublogarithmic randomized algorithms for the symmetry breaking problems Recently significant progress was achieved in the study of these questions More efficient deterministic and randomized 1 coloring algorithms were achieved Deterministic $O(1)$ coloring algorithms with polylogarithmic running time were devised Improved and often sublogarithmic time randomized algorithms were devised Drastically improved lower bounds were given Wide families of graphs in which these problems are solvable much faster than on general graphs were identified The objective of our monograph is to cover most of these developments and as a result to provide a treatise on theoretical foundations of distributed symmetry breaking in the message passing model We hope that our monograph will stimulate further progress in this exciting area
