4. Input force: 735 N
Output force: 7,350 N
Mechanical advantage: $\frac{7,350 \text{ N}}{735 \text{ N}} = 10$

5. Efficiency: $\frac{367.5 \text{ J}}{367.5 \text{ J}} \times 100\% = 100\%$

This is complete efficiency and is very unlikely. Friction would cause a real treadmill to be less efficient.

Chapter 5 Project Worksheet 1 (p. 118)

1. The vehicle will not have enough energy to get up the second hill. The potential energy of a vehicle on the first hill would be less than the potential energy of a vehicle on the second hill. The vehicle would require energy input to get up the second hill.
2. In a frictionless system, this would work; however, the vehicle will lose energy because of friction against both the track and the air. The vehicle would not make it up the second hill.
3. It might be possible for the vehicle to complete this type of track. However, success will depend on the height of the first hill and the distance between the hills. If the vehicle has enough potential energy on the first hill and does not expend the energy on long distances between the hills, this setup would work.
4. The materials that the students select may vary. Make sure that they are readily available to the students at a reasonable price. Also, make sure that the students have selected materials that are easy to modify.
