Physics and Chemistry of the Earth's Interior Alok Krishna Gupta, 2011-10-06 The Indian National Science Academy was established in January 1935 with the objective of promoting science in India and harnessing scientific knowledge for the cause of humanity and national welfare In 1968 it was designated as the adhering organisation in India to the International Council for Scientific Union ICSU on behalf of the Government of India Over the years the Academy has published a number of journals volumes biographical memoirs etc The year 2009 2010 will be specially celebrated to mark the Platinum Jubilee of the Academy Many programmes are planned in different centres in India on this occasion In addition the Academy has decided to publish a number of special volumes on different subjects ranging from earth sciences to life sciences This volume is on Physics and Chemistry of the Earth's Interior One of the main objectives of geophysicists is to establish the internal structure of the earth as revealed by seismic tomography It is also their primary goal to correlate geophysical data to reveal thermal and chemical state of the crust mantle and core of the earth In order to interpret seismic velocities and associated density and elastic properties in terms of mineralogical and petrological models of the earth's interior thermodynamic and high pressure temperature data from mineral physics are essential With the advent of different types of multi anvil and laser heated

diamond anvil equipment it is now possible to simulate conditions prevalent even in the lower mantle and core of the earth

Radionuclide and Metal Sorption on Cement and Concrete Michael Ochs, Dirk Mallants, Lian Wang, 2015-10-17

Cementitious materials are being widely used as solidification stabilisation and barrier materials for a variety of chemical and radioactive wastes primarily due to their favourable retention properties for metals radionuclides and other contaminants. The retention properties result from various mineral phases in hydrated cement that possess a high density and diversity of reactive sites for the fixation of contaminants through a variety of sorption and incorporation reactions. This book presents a state of the art review and critical evaluation of the type and magnitude of the various sorption and incorporation processes in hydrated cement systems for twenty five elements relevant for a broad range of radioactive and industrial wastes. Effects of cement evolution or ageing on sorption incorporation processes are explicitly evaluated and quantified. While the immobilisation of contaminants by mixing in during hydration is not explicitly addressed the underlying chemical processes are similar. A quantitative database on the solid liquid distribution behaviour of radionuclides and other elements in hydrated cement systems is established on the basis of a consistent review and re evaluation of literature data. In addition to recommended values all underlying original experimental data and key experimental information are provided which allows users to trace the given recommendations or to develop their own set of key values. This database is closely tied to the safety analysis of near surface disposal of radioactive waste in Belgium. It focuses on radioelements, toxic stable elements and heavy metals which makes it relevant for investigations involving the interaction of radioactive and conventional contaminants with cement based barriers.
