Android 4.3 User Manual Guide:

OpenGL ES 3.0 Programming Guide Dan Ginsburg, Budirijanto Purnomo, Dave Shreiner, Aaftab Munshi, 2014-02-28

OpenGL ES™ is the industry's leading software interface and graphics library for rendering sophisticated 3D graphics on handheld and embedded devices. The newest version, OpenGL ES 3.0, makes it possible to create stunning visuals for new games and apps without compromising device performance or battery life. In the OpenGL ES™ 3.0 Programming Guide, Second Edition, the authors cover the entire API and Shading Language. They carefully introduce OpenGL ES 3.0 features such as shadow mapping, instancing, multiple render targets, uniform buffer objects, texture compression, program binaries, and transform feedback. Through detailed, downloadable C-based code examples, you'll learn how to set up and program every aspect of the graphics pipeline. Step by step, you'll move from introductory techniques all the way to advanced per-pixel lighting and particle systems. Throughout, you'll find cutting-edge tips for optimizing performance, maximizing efficiency with both the API and hardware, and fully leveraging OpenGL ES 3.0 in a wide spectrum of applications. All code has been built and tested on iOS 7, Android 4.3, Windows, OpenGL ES 3.0 Emulation, and Ubuntu Linux, and the authors demonstrate how to build OpenGL ES code for each platform. Coverage includes EGL API, communicating with the native windowing system, choosing configurations, and creating rendering contexts and surfaces. Shaders: creating and attaching shader objects, compiling shaders, checking for compile errors, creating, linking, and querying program objects, and using source shaders and program binaries. OpenGL ES Shading Language: variables, types, constructors, structures, arrays, attributes, uniform blocks, I/O variables, precision qualifiers, and invariance. Geometry: vertices and primitives, inputting geometry into the pipeline, and assembling it into primitives. 2D/3D: Cubemap, Array texturing, creation, loading, and rendering, texture wrap modes, filtering, and formats, compressed textures, sampler objects, immutable textures, pixel unpack, buffer objects, and mipmapping. Fragment shaders: multitexturing, fog, alpha test, and user clip planes. Fragment operations: scissor, stencil, and depth tests, multisampling, blending, and dithering. Framebuffer objects: rendering to offscreen surfaces for advanced effects. Advanced rendering: per-pixel lighting, environment mapping, particle systems, image post-processing, procedural textures, shadow mapping, terrain, and projective texturing. Sync: objects and fences, synchronizing within host application and GPU execution. This edition of the book includes a color insert of the OpenGL ES 3.0 API and OpenGL ES Shading Language 3.0 Reference Cards created by Khronos. The reference cards contain a complete list of all of the functions in OpenGL ES 3.0, along with all of the types, operators, qualifiers, built-ins, and functions in the OpenGL ES Shading Language.

The Frankencamera Eino-Ville Aleksi Talvala, 2011 Digital cameras both in traditional form factors and as parts of cell phones have become ubiquitous over the last decade But for the most part they remain black boxes to the end user and cannot be reprogrammed or modified This has become an obstacle to researchers in the new field of computational photography who want to use the growing computing power of digital cameras to create images no

traditional camera could produce This dissertation presents the Frankencamera platform a digital camera system designed for computational photography The Frankencamera is a fully open fully programmable digital camera which can be easily modified to test out new research ideas The Frankencamera architecture allows for per frame control of the capture process and accurate synchronization of all the components that make up the camera Based on this architecture this dissertation details two hardware platforms the F2 a flexible custom built camera and the Nokia N900 a commercial smartphone Both platforms can be easily programmed at a high level using the FCam API written to embody the Frankencamera architecture Finally this dissertation presents several sample applications for the Frankencamera platform Several of these applications could not have been developed for any existing camera platform and the ease and speed at which they were written show that the Frankencamera platform is a compelling tool for computational photography

Wearable Interaction Vivian Genaro Motti, 2020-01-01 This book offers the reader a comprehensive view of the design space of wearable computers cutting across multiple application domains and interaction modalities Besides providing several examples of wearable technologies Wearable Interaction illustrates how to create and to assess interactive wearables considering human factors in design decisions related to input entry and output responses The book also discusses the impacts of form factors and contexts of use in the design of wearable interaction Miniaturized components flexible materials and sewable electronics toolkits exemplify advances in technology that facilitated the design and development of wearable technologies Despite such advances creating wearable interfaces that are efficient is still challenging The new affordances of on body interfaces require the consideration of new interaction paradigms so that the design decisions for the user interaction take into account key limitations in the interaction surfaces of wearables concerning input entry processing power for output responses and in the time and attention that wearers dedicate to complete their interaction Under such constraints creating interfaces with high usability levels is complex Also because wearables are worn continuously and in close contact with the human body on body interfaces must be carefully designed to neither disturb nor overwhelm wearers The context of use and the potential of wearable technologies must be both well understood to provide users with relevant information and services using appropriate approaches and without overloading them with notifications Wearable Interaction explains thoroughly how interactive wearables have been created taking into account the needs of end users as well as the vast potential that wearable technologies offer Readers from academia industry or government will learn how wearables can be designed and developed to facilitate human activities and tasks across different sectors
