

The Digestive Process

The digestive system

The digestive system, or gastrointestinal tract, is essentially a muscular tube in which food is broken down into absorbable nutrients and eliminated as waste. Food enters the mouth, is chewed, and is propelled through a series of different accessory and absorptive components. Within these components, food is digested (broken down) by digestive enzymes and components that absorb it. The digestive system also stores undigested components until they are ready to be expelled at the end of the gastrointestinal tract.

Food is chewed and swallowed in about 1 minute.

Food moves through the stomach in 2 to 4 hours.

After leaving the stomach, chyme moves into the duodenum, the first part of the small intestine, where it is mixed with bile produced by the liver and pancreatic juice produced by the pancreas. Enzymes help to break up the food.

Labels: Duodenum, Jejunum, Ileum.

Digestion & absorption

Digestion & absorption

Elimination

Chewing & swallowing

Chewing, the mechanical action of the mouth and tongue, begins the breakdown of solid food. This greatly increases food's surface area and exposes the food to the action of the salivary glands. Saliva contains the food and begins the digestion of starch. The mixture of food and saliva is called a *bolus*. In the bolus, the pharynx, the esophagus, a flap-like valve, and the vocal cord contract, forcing the bolus forward, where it moves into the esophagus for the stomach.

Peristaltic action

Material is moved through the digestive system by a series of muscle contractions called peristalsis. The muscle is relaxed in the material contents, while the muscle above contracts, forcing the material into the next section.

In the esophagus, material moves through the large intestine, where it is absorbed and water is absorbed (dehydration). This material moves in a forward and backward motion.

Colonic movement

Movement through the large intestine is accomplished through the contractions of the longitudinal and circular muscles. Types of movement include peristaltic action, segmentation, and mass movement. Movement of food through the large intestine is slower than through the small intestine, allowing for absorption of water.

Types of movement

Segmentation action

In regular intervals, ring-like contractions (chase and pass the water material) that do not move the material along. This process is called segmentation.

Muscle contractions begin to break up the material.

Continuing muscle contractions produce further mixing.

The water material has been mixed, but not moved.
