research** Raffaele d'Isa,Stefania Fasano,Riccardo Brambilla,2024-07-03 Rodent behavioral testing has been used to study
brain functions since the 1890s and has become a gold standard model in modern neuroscience Up to the 1950s most
behavioral tests on laboratory rodent models were based on punishments and rewards Both approaches can lead to a certain
degree of animal pain or suffering Punishments involved the employment of painful stimuli typically electric shocks Passive
avoidance and fear conditioning tests among the most widely used behavioral paradigms used to evaluate learning and
memory in rodents can be performed using only a single brief shock Other tests such as the active avoidance might require
up to tens or hundreds of shocks strongly challenging the psychological welfare of the model animals On the other hand tests
based on rewards which apparently may seem more ethical actually still induce suffering in the animals as food rewards are
almost always associated with a food restriction protocol in order to motivate food seeking behavior Rodents are starved for
days before starting the test and kept under food restriction for the whole duration of the test The distress during the testing
session is only a minimal part compared to the stress lived outside of the testing session which is prolonged and continuous
Analogously liquid rewards commonly rely on a previous water restriction protocol to use thirst as motivation Animal stress is
not only an ethical issue per se but also an important factor potentially impacting on the reliability and reproducibility of

Aluminium and Alzheimer's Disease C. Exley, 2001-07-03 The subject of aluminium and Alzheimer's disease has been plagued with controversy This controversy has served to obscure much of the scientific research in this field and subsequently has obscured the possibility that aluminium is a contributory factor in the aetiology of Alzheimer's disease This book brings together many of the world's leading scientists researching aluminium and life and contains their critical summaries on the known facts about aluminium toxicity in man and to offer an opinion on the implications of this knowledge on a link between aluminium and Alzheimer's disease The subject areas of the chapters were chosen to reflect the myriad of ways that aluminium is known to impact upon mammalian physiology and function and range from clinical studies through animal models of disease to the detailed biochemistry of aluminium toxicity Chapters are also included on epidemiology and other factors involved in the aetiology of Alzheimer's This is the first time that this subject has been treated in such a comprehensive manner The research detailed in each chapter includes the latest research in the field it has been critically appraised and this appraisal has been used by each author to present an informed opinion of its relevance to aluminium and Alzheimer's disease The chapters are much more than reviews they are a statement of the state
