Unmanned Systems of World Wars I and II H. R.

Everett,2015-11-06 The first comprehensive technical history of air land sea and underwater unmanned systems by a distinguished U S Navy roboticist Military drones have recently been hailed as a revolutionary new technology that will forever change the conduct of war And yet the United States and other countries have been deploying such unmanned military systems for more than a century Written by a renowned authority in the field this book documents the forgotten legacy of these pioneering efforts offering the first comprehensive historical and technical accounting of unmanned air land sea and underwater systems Focusing on examples introduced during the two world wars H R Everett meticulously traces their development from the mid nineteenth century to the early Cold War A pioneering Navy roboticist Everett not only describes these systems in detail but also reverse engineers the designs in order to explain how they operated in real world conditions of the time More than 500 illustrations photographs drawings and plans many of them never before published accompany the text Everett covers the evolution of early wire guided submersibles tracing the development of power propulsion communication and control radio controlled surface craft deployed by both Germany and Great Britain in World War I radio controlled submersibles radio controlled aircraft including the TDR 1 assault drone project in World War II which laid the groundwork for subsequent highly classified drone programs and remote controlled ground vehicles including the Wehrmacht s Goliath and Borgward demolition carriers

Applied Differential Geometry: A Modern Introduction

Vladimir G Ivancevic,Tijana T Ivancevic,2007-05-21 This graduate level monographic textbook treats applied differential geometry from a modern scientific perspective Co authored by the originator of the world s leading human motion simulator Human Biodynamics Engine a complex 264 DOF bio mechanical system modeled by differential geometric tools this is the first book that combines modern differential geometry with a wide spectrum of applications from modern mechanics and physics via nonlinear control to biology and human sciences The book is designed for a two semester course which gives mathematicians a variety of applications for their theory and physicists as well as other scientists and engineers a strong theory underlying their models

Selected papers from the 2nd International Symposium on UAVs, Reno, U.S.A.

June 8-10, 2009 Kimon P. Valavanis,Randal Beard,Paul Oh,Aníbal Ollero,Leslie A. Piegl,Hayong Shin,2011-04-11 In the last

decade significant changes have occurred in the field of vehicle motion planning and for UAVs in particular UAV motion planning is especially difficult due to several complexities not considered by earlier planning strategies the increased importance of differential constraints atmospheric turbulence which makes it impossible to follow a pre computed plan precisely uncertainty in the vehicle state and limited knowledge about the environment due to limited sensor capabilities These differences have motivated the increased use of feedback and other control engineering techniques for motion planning The lack of exact algorithms for these problems and difficulty inherent in characterizing approximation algorithms makes it impractical to determine algorithm time complexity completeness and even soundness This gap has not yet been addressed by statistical characterization of experimental performance of algorithms and benchmarking Because of this overall lack of knowledge it is difficult to design a guidance system let alone choose the algorithm Throughout this paper we keep in mind some of the general characteristics and requirements pertaining to UAVs A UAV is typically modeled as having velocity and acceleration constraints and potentially the higher order differential constraints associated with the equations of motion and the objective is to guide the vehicle towards a goal through an obstacle field A UAV guidance problem is typically characterized by a three dimensional problem space limited information about the environment on board sensors with limited range speed and acceleration constraints and uncertainty in vehicle state and sensor data

Remote Sensing and Actuation Using Unmanned Vehicles Haiyang Chao, Yang Chen, 2012-08-28 Unmanned systems and robotics technologies have become very popular recently owing to their ability to replace human beings in dangerous tedious or repetitious jobs This book fills the gap in the field between research and real world applications providing scientists and engineers with essential information on how to design and employ networked unmanned vehicles for remote sensing and distributed control purposes Target scenarios include environmental or agricultural applications such as river reservoir surveillance wind profiling measurement and monitoring control of chemical leaks

Novel Haptic Cues for UAV Tele-Operation Samantha Alaimo, 2014-01-15 Outlines three case studies obstacle avoidance wind gust rejection and a combination of the two In each case Direct Haptic Aid DHA and Indirect Haptic Aid IHA systems are designed and compared against baseline performance with no haptic aid This work aims to show that IHA is a valid and promising alternative to the other approaches which fall into the DHA category
