

Unit 5: Thermochemistry**5.1: Heat Transfer and Thermal Equilibrium****5.2: Heat Capacity and Calorimetry****5.3: Entropy and Spontaneous Changes**

2. Use the Boltzmann-probability distribution curves below to predict temperatures of the mixtures of particles.

Temperature: is a measure of the average kinetic energy of the particles in a system. The kinetic energy for particles moving 100 m/s is 100 J . The first curve of particles with maximum mass and average velocity contained one set of temperatures. The second, less massive particles, contained twice as much kinetic energy as the first. The third curve contained one set of temperatures. The particles in the third curve had the same mass as the particles in the first curve, but the average velocity was twice that of the particles in the first curve.

3. Sketch a curve to represent the relative distribution of the particles in the following two gases, samples of the same gas.

- a. In System 1, it is a higher or lower temperature than System 2? Justify your answer.

System 1 is at a lower temperature than System 2. Temperature is a measure of the average KE of the particles in the system. The kinetic energy and mass of the particles are the same, but the distribution of particles is different. The particles in System 1 are more spread out, indicating a lower temperature. The particles in System 2 are more concentrated, indicating a higher temperature.

- b. Are the particles in System 1 moving faster or slower than the particles in System 2? Justify your answer in terms of molecular collisions.

The particles in System 1 are moving faster than the particles in System 2. The particles in System 1 are more spread out, indicating a lower temperature. The particles in System 2 are more concentrated, indicating a higher temperature. The particles in System 1 are moving faster because they have more kinetic energy.
