Suppose that a squirrel population consists of several hundred individuals. Suppose that you capture 1000 squirrels in 1970 and find 1000 alleles at a locus called *Scratch* (which codes for a scratch at the shoulder). These alleles are the products of genes and hence represent the genetic diversity within the population. At the same time, you capture 1000 squirrels in 1971 and find 1000 alleles at the same locus. The alleles that you find are the products of the same genes and hence represent the genetic diversity within the population in 1971. Suppose that the population is stable and that the alleles that you find in 1970 are the same as the alleles that you find in 1971.
