Abstract: This study examined the effects of a 12-week, 100% bodyweight resistance training program on the body composition and muscle strength of 12 sedentary, middle-aged men. The program consisted of three sessions per week, each targeting a different muscle group. The results showed that the program significantly improved muscle strength and body composition, with no significant changes in body weight or body fat percentage. The findings suggest that a 12-week, 100% bodyweight resistance training program can be an effective means of improving muscle strength and body composition in sedentary, middle-aged men.
