A Textbook of Physiological Psychology Sebastian Peter Grossman,1967 **Cognitive, Motor, and Behavioral Correlates of Functional Decline in Huntington's Disease** Joanne Marie Hamilton,2000 Huntington's disease HD is a neurodegenerative disease that produces progressive cognitive motor and behavioral dysfunction that eventually interferes with independent living While numerous studies have documented executive dysfunction and frontal lobe behavioral changes in HD patients none have systematically examined the emergence and interrelationship of these changes Furthermore none have examined how cognitive behavioral and motor deficits might differentially affect functional independence in activities of daily living ADL Thus the goals of the present study were to examine the emergence of executive dysfunction and behavioral changes in a cross sectional study of presymptomatic and affected HD mutation carriers to examine the relationship between cognitive and behavioral changes in these individuals with respect to theories of distinct frontostriatal syndromes and to evaluate the contribution of cognitive behavioral and motor dysfunction to functional disability in patients with HD These goals were addressed in three

experiments that included 13 at risk HD mutation carriers AR 16 at risk noncarriers AR 27 symptomatic HD patients HD and 20 normal control NC subjects Cognitive measures included a delayed response task an object alternation task and the pattern recognition spatial recognition and spatial working memory subtests of the Cambridge Neuropsychological Test Automated Battery CANTAB Behavioral measures included the Frontal Lobe Personality Scale and a Psychiatric Rating Scale To measure functional capacity the Huntington s Disease Activities of Daily Living Scale and the Direct Assessment of Functional Status were completed Experiment 1 demonstrated that only moderately affected patients with HD have setshifting deficits on the delayed response task Experiment 2 showed that the pattern of dysfunction exhibited by mutation carriers on the CANTAB cognitive measures and the behavioral rating scales did not conform to the distinct cognitive behavior patterns thought to be associated with orbitofrontal and dorsolateral frontostriatal circuits respectively However the results of this experiment did show that behavioral ratings of apathy and executive dysfunction had a stronger relationship to the CANTAB cognitive measures than did behavioral ratings of disinhibition Finally Experiment 3 demonstrated that behavioral ratings of apathy and executive dysfunction but not measures of cognitive ability were effective predictors of functional disability in ADLs in HD mutation carriers
