

The Digestive System

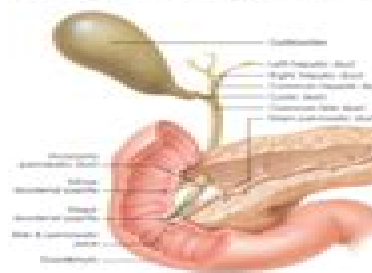

What is the digestive system?

The digestive system, or **gastrointestinal tract**, is a tract of organs that is responsible for digesting and absorbing nutrients from food. Food is broken down mechanically in the mouth, is digested through a series of chemical reactions, and is absorbed into the bloodstream. The digestive system also stores food for digestion and eliminates waste from the body. The digestive system also stores food for digestion and eliminates waste from the body.

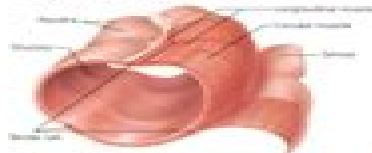

Liver, pancreas & gallbladder

After leaving the stomach, chyme moves into the duodenum, the first part of the small intestine, where it is mixed with bile secreted by the **liver** and pancreatic juice secreted by the **pancreas**. This area is a mixing region on the intestine where the duodenum opens into the descending large intestine. Bile from the liver, secreted into the duodenum, flows into the **gallbladder**.

Layers of large intestine

Large intestine

The large intestine consists of the cecum, the colon, and the rectum. The cecum is a large pouch that receives chyme from the small intestine. The colon is a long tube that absorbs water and electrolytes from the chyme. The rectum is the final part of the large intestine, where the waste is stored before being eliminated from the body.

Peristaltic action

Food material is pushed through the digestive system by a series of powerful muscular contractions called peristalsis. These contractions move the material forward and the food is then, what the stomach has released.

The mouth & salivary glands

Chewing the food breaks it into smaller pieces, making it easier to swallow. Saliva, secreted by the salivary glands, moistens the food and helps the mechanical breakdown of the food. Saliva also contains the enzyme amylase, which begins the chemical digestion of starches. The food is then swallowed and moves down the esophagus to the stomach.

The stomach

The stomach is a large, muscular organ that is responsible for the mechanical and chemical digestion of food. It is located in the upper left part of the abdomen. Food enters the stomach from the esophagus and is mixed with gastric juice, which contains the enzyme pepsin. The stomach wall has three layers: the mucosa, the submucosa, and the muscularis. The muscularis is responsible for the churning motion of the stomach.

Small intestine

The small intestine is a long, coiled tube that is responsible for the chemical digestion of food. It is located in the lower right part of the abdomen. Food enters the small intestine from the stomach and is mixed with pancreatic juice and bile. The small intestine has three parts: the duodenum, the jejunum, and the ileum. The duodenum is the first part, where most of the chemical digestion occurs. The jejunum is the middle part, where most of the absorption occurs. The ileum is the last part, where the remaining nutrients are absorbed.

Absorption

The small intestine is the site of the absorption of the nutrients from the food. The nutrients are absorbed into the bloodstream through the villi. The villi are small, finger-like projections that increase the surface area of the intestinal lining. The nutrients are absorbed into the capillaries and the lymphatic system.
