***ICT Development in Education & Special Education* Dr Deepak Kumar**

Tripathi, Ajit Kumar, 2024-10-25 Education is a vital part of growing up Everyone goes through the education system to help carve a path towards their future self and what career they want to focus on as they get older However what most people become confused on is the difference between general education and special education General education is the education provided to students who physically attend school Now special education is the education provided by the school plus extra programs and services to help aid and guide the students through the general education Special Education is defined as the means through which children who have disabilities receive an education specifically designed to help them reach their learning potential Friend ICT in education is becoming increasingly important and has potential advantages to disabled learners if the technologies are appropriately designed including for accessibility and usability and used This paper presents

the first sets of recommendations for learning technologies for disabled people aimed at disabled learners teachers developers and educational institutions respectively They were developed as part of the work of the Enable Network for ICT Learning for Disabled People and involved input from both experts and end users The concise format facilitates production in a variety of formats and languages for accessibility and wide distribution The paper discusses the recommendations and their relationship to existing guidelines The results indicated that these students felt ready to use the technology resources in their studies However they did not receive support by the teachers and they noticed differences in approach depending on the stage of the educational course and the type of disability This book has been written for the education of Divyang people on ICT and communication which includes the use of ICT in their education what is the use of ICT what is the importance of ICT how can it contribute how can we help Divyang people to become self dependent authors are publishing articles on various aspects in it which will not only help in bringing fundamental changes in the education of Divyangs but also in their lives so that not only India but the interest towards ICT will come from it how can we simplify and improve our education various people have given their views

MorphoEvoDevo: A Multilevel Approach to Elucidate the Evolution of Metazoan Organ Systems ,2023-11-10 Analyzing animal development in a comparative framework provides a unique window into evolutionary history With a long tradition that dates back to iconic 19th century zoologists such as Ernst Haeckel and Charles Darwin Evolutionary Developmental Biology is firmly rooted in morphological research While studies using a classical model system approach have resulted in considerable methodological progress in particular by establishing molecular genetic tools to tackle questions surrounding animal development it quickly became

obvious that a broad comparative dataset involving as many taxa as possible is necessary for sound evolutionary inferences. Thus today's EvoDevo embraces morphological, molecular, and experimental procedures interpreted in a phylogenetic framework in order to answer key questions that revolve around the evolution of animal cell types, organ systems, and ultimately entire species.

Introducing Puppetry Peter Fraser, 1968 Endocrine Regulation and Physiological Adaptation of Stress Response in Aquatic Organisms, Volume II Yiming Li, Marco António Campinho, Yi-Feng Li, Juan Fuentes, 2025-01-07

Organismal growth is a multi-gene regulatory process that integrates various physiological signaling pathways *in vivo* from energy metabolism to somatic growth. In fully developed animals, endocrine regulation assures that homeostasis and growth can adapt the organism to changing environmental and biological conditions, thus being the central regulatory hub for physiological responses. Much attention has been paid to the endocrine regulation of aquatic organism growth and regulation. These endocrine systems include neuroendocrine and insulin-like growth factors and their downstream molecules. Many signaling molecules promote tissue growth and regulate the metabolism of many nutrients *in vivo*. Like other animals, aquatic animals respond to environmental stimuli through endocrine regulation that modulates physiological and environmental responses. Environmental stressors can affect aquatic ecosystems and their inhabitants, including but not limited to temperature, hypoxia, salinity, heavy metal, nanomaterials, pesticides, microplastics, and other toxic pollutants. The presence of stress disrupts the homeostasis of aquatic animals, inducing physiological, molecular, and behavioral changes. Research into the endocrine regulation and physiological adaptation in aquatic organisms and the molecular mechanisms involved can aid in forecasting danger and assessing physiological well-being. That has never been more present than now amid climate change, where aquatic environments are amongst the most susceptible biomes. This research topic addresses these emergent questions by inviting studies investigating and discussing the molecular and cellular mechanisms of endocrine regulation and physiological adaptation in aquatic organisms to environmental stresses. Gaining an insight into the current knowledge of these responses and the related mechanisms will give us a deeper understanding of aquatic animal biology and adaptation.

Repetitive DNA Sequences Andrew G. Clark, Daniel A. Barbash, Sarah E. Lower, Anne-Marie Dion-Côté, 2020-03-05

Repetitive DNA is ubiquitous in eukaryotic genomes and in many species comprises the bulk of the genome. Repeats include transposable elements that can self-mobilize and disperse around the genome and tandemly repeated satellite DNAs that increase in copy number due to replication slippage and unequal crossing over. Despite their abundance, repetitive DNA is often ignored in genomic studies due to technical challenges in their identification, assembly, and quantification. New technologies and methods are now providing the unprecedented power to analyze repetitive DNAs across diverse taxa. Repetitive DNA is of particular interest because it can represent distinct modes

of genome evolution Some repetitive DNA forms essential genome structures such as telomeres and centromeres which are required for proper chromosome maintenance and segregation whereas others form piRNA clusters that regulate transposable elements thus these elements are expected to evolve under purifying selection In contrast other repeats evolve selfishly and produce genetic conflicts with their host species that drive adaptive evolution of host defense systems However the majority of repeats likely accumulate in eukaryotes in the absence of selection due to mechanisms of transposition and unequal crossing over Even these neutral repeats may indirectly influence genome evolution as they reach high abundance In this Special Issue the contributing authors explore these questions from a range of perspectives
