

5 Points of Darwin's Natural Selection

Read the following situations below and identify the 5 points of Darwin's natural selection.

- 1) There are 2 types of worms: worms that eat at night (nocturnal) and worms that eat during the day (diurnal). The birds eat during the day and seem to be eating **ONLY** the diurnal worms. The nocturnal worms are in their burrows during this time. Each spring when the worms reproduce, they have about 500 babies but only 100 of these 500 ever become old enough to reproduce.

- a. What worm has natural selection selected AGAINST? diurnal worms FOR? nocturnal worms
- b. Darwin's 5 points: Identify the 5 points in the scenario above.
- Population has variations. There are 2 types of worms in the area (diurnal and nocturnal)
- Some variations are favorable. Birds do not eat nocturnal worms (nocturnal worms advantage)
- More offspring are produced than survive. 100 of the original 500 worms survive to reproduce
- Those that survive have favorable traits. More nocturnal worms survive and reproduce
- A population will change over time. Nocturnal worm population increases; diurnal worm population decreases

- 2) There are 3 types of polar bears: ones with thick coats, ones with thin coats and ones with medium coats. It is fall, soon to be winter. The temperatures are dropping rapidly and the bears must be kept warm, or they will freeze to death. Many of the bears have had 2 cubs each but due to the extreme temperatures, many mothers only have one cub left.
- a. What bear will natural selection select AGAINST? thin coats FOR? thick coats
- b. Darwin's 5 points: Identify the 5 points in the scenario above.
- Population has variations. There are 3 types of bears (thick, medium, and thin)

Explanation in Ethics and Mathematics Uri D. Leibowitz, Neil Sinclair, 2016 How far should our realism extend For many years philosophers of mathematics and philosophers of ethics have worked independently to address the question of how best to understand the entities apparently referred to by mathematical and ethical talk But the similarities between their endeavours are not often emphasised This book provides that emphasis In particular it focuses on two types of argumentative strategies that have been deployed in both areas The first debunking arguments aims to put pressure on realism by emphasising the seeming redundancy of mathematical or moral entities when it comes to explaining our judgements In the moral realm this challenge has been made by Gilbert Harman and Sharon Street in the mathematical realm it is known as the Benacerraf Field problem The second strategy indispensability arguments aims to provide support for realism by emphasising the seeming intellectual indispensability of mathematical or moral entities for example when constructing good explanatory theories This strategy is associated with Quine and Putnam in mathematics and with Nicholas Sturgeon and David Enoch in ethics *Explanation in Ethics and Mathematics* addresses these issues through an explicitly comparative methodology which we call the companions in illumination approach By considering how argumentative strategies in the philosophy of mathematics might apply to the philosophy of ethics and vice versa the papers collected here break new ground in both areas For good measure two further companions for illumination are also broached the philosophy of chance and the philosophy of religion Collectively these comparisons light up new questions arguments and problems of interest to scholars interested in realism in any area
