Algebra Chapter 8:

Algebra N. Bourbaki, 2024-03-30 This book is an English translation of an entirely revised version of the 1958 edition of the eighth chapter of the book *Algebra* the second Book of the *Elements of Mathematics* It is devoted to the study of certain classes of rings and of modules in particular to the notions of Noetherian or Artinian modules and rings as well as that of radical This chapter studies Morita equivalence of module and algebras it describes the structure of semisimple rings Various Grothendieck groups are defined that play a universal role for module invariants The chapter also presents two particular cases of algebras over a field The theory of central simple algebras is discussed in detail their classification involves the Brauer group of which several descriptions are given Finally the chapter considers group algebras and applies the general theory to representations of finite groups At the end of the volume a historical note taken from the previous edition recounts the evolution of many of the developed notions

Feingold, Igor Frenkel, John F. X. Ries, 1991 The theory of vertex operator algebras is a remarkably rich new mathematical field which captures the algebraic content of conformal field theory in physics Ideas leading up to this theory appeared in physics as part of statistical mechanics and string theory In mathematics the axiomatic definitions crystallized in the work of

Borchers and in Vertex Operator Algebras and the Monster by Frenkel, Lepowsky and Meurman. The structure of monodromies of intertwining operators for modules of vertex operator algebras yield braid group representations and leads to natural generalizations of vertex operator algebras such as superalgebras and para algebras. Many examples of vertex operator algebras and their generalizations are related to constructions in classical representation theory and shed new light on the classical theory. This book accomplishes several goals. The authors provide an explicit spinor construction using only Clifford algebras of a vertex operator superalgebra structure on the direct sum of the basic and vector modules for the affine Kac-Moody algebra D_n . They also review and extend Chevalley's spinor construction of the 24-dimensional commutative nonassociative algebraic structure and triality on the direct sum of the three 8-dimensional D_4 modules. Vertex operator para algebras introduced and developed independently in this book and by Dong and Lepowsky are related to one-dimensional representations of the braid group. The authors also provide a unified approach to the Chevalley-Greiss and E_8 algebras and explain some of their similarities. A third goal is to provide a purely spinor construction of the exceptional affine Lie algebra E_8 , a natural continuation of previous work on spinor and oscillator constructions of the classical affine Lie algebras. These constructions should easily extend to include the rest of the exceptional affine Lie algebras. The final objective is to develop an inductive technique of construction which could be applied to the Monster vertex operator algebra. Directed at mathematicians and physicists, this book should be accessible to graduate students with some background in finite-dimensional Lie algebras and their representations. Although some experience with affine Kac-Moody algebras would be useful, a summary of the relevant parts of that theory is included. This book shows how the concepts and techniques of Lie theory can be generalized to yield the algebraic structures associated with conformal field theory. The careful reader will also gain a detailed knowledge of how the spinor construction of classical triality lifts to the affine algebras and plays an important role in the spinor construction of vertex operator algebras, modules and intertwining operators with nontrivial monodromies.
