Analysis of Numerical Methods Eugene Isaacson, Herbert Bishop Keller, 2012-04-26 This excellent text for advanced undergraduate and graduate students covers norms numerical solutions of linear systems and matrix factoring eigenvalues and eigenvectors polynomial approximation and more Many examples and problems 1966 edition **Numerical Methods**

for Two-Point Boundary-Value Problems Herbert B. Keller, 2018-11-14 Elementary yet rigorous this concise treatment explores practical numerical methods for solving very general two point boundary value problems The approach is directed toward students with a knowledge of advanced calculus and basic numerical analysis as well as some background in ordinary differential equations and linear algebra After an introductory chapter that covers some of the basic prerequisites the text studies three techniques in detail initial value or shooting methods finite difference methods and integral equations methods Sturm Liouville eigenvalue problems are treated with all three techniques and shooting is applied to generalized or nonlinear eigenvalue problems Several other areas of numerical analysis are introduced throughout the study The treatment concludes with more than 100 problems that augment and clarify the text and several research papers appear in the Appendixes

Rostamian, 2014-09-03 Like a pianist who practices from a book of tunes readers of Programming Projects in C for Students of Engineering Science and Mathematics will learn by doing Written as a tutorial on how to think about organize and implement programs in scientific computing this book achieves its goal through an eclectic and wide ranging collection of projects Each project presents a problem and an algorithm for solving it The reader is guided through implementing the algorithm in C and compiling and testing the results It is not necessary to carry out the projects in sequential order The projects contain suggested algorithms and partially completed programs for implementing them to enable the reader to exercise and develop skills in scientific computing require only a working knowledge of undergraduate multivariable calculus differential equations and linear algebra and are written in platform independent standard C and the Unix command line is used to illustrate compilation and execution The primary audience of this book is graduate students in mathematics engineering and the sciences The book will also be of interest to advanced undergraduates and working professionals who wish to exercise and hone their skills in programming mathematical algorithms in C A working knowledge of the C programming language is assumed **Numerical Partial Differential Equations: Finite Difference Methods** J.W.

Thomas, 2013-12-01 This text will be divided into two books which cover the topic of numerical partial differential equations Of the many different approaches to solving partial differential equations numerically this book studies difference methods Written for the beginning graduate student this text offers a means of coming out of a course with a large number of methods which provide both theoretical knowledge and numerical experience The reader will learn that numerical experimentation is a part of the subject of numerical solution of partial differential equations and will be shown some uses and taught some techniques of numerical experimentation Mathematics of Approximation Johan De Villiers, 2012-06-30 The approximation of a continuous function by either an algebraic polynomial a trigonometric polynomial or a spline is an important issue in application areas like computer aided geometric design and signal analysis This book is an introduction to the mathematical

analysis of such approximation and with the prerequisites of only calculus and linear algebra the material is targeted at senior undergraduate level with a treatment that is both rigorous and self contained The topics include polynomial interpolation Bernstein polynomials and the Weierstrass theorem best approximations in the general setting of normed linear spaces and inner product spaces best uniform polynomial approximation orthogonal polynomials Newton Cotes Gauss and Clenshaw Curtis quadrature the Euler Maclaurin formula approximation of periodic functions the uniform convergence of Fourier series spline approximation with an extensive treatment of local spline interpolation and its application in quadrature Exercises are provided at the end of each chapter
