

The Digestive System

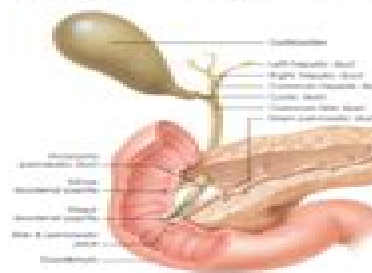

What is the digestive system?

The digestive system, or **gastrointestinal tract**, is a tract of organs that is responsible for digesting and absorbing nutrients from food. Food is broken down mechanically in the mouth or physically through a series of chemical reactions and enzymatic processes, allowing nutrients to be absorbed. The digestive system also removes indigestible components that enter the body, such as feces, in the form of the gastrointestinal tract.

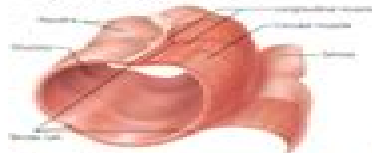

Liver, pancreas & gallbladder

After leaving the stomach, digested material enters the duodenum, the first part of the small intestine, which is connected to the pancreas. The pancreas produces pancreatic juice, which is secreted into the duodenum. This juice is a strong enzyme that helps break down the food. The pancreas also produces insulin, a hormone that regulates blood sugar levels. The liver and gallbladder also play a role in digestion. The liver produces bile, which is stored in the gallbladder.

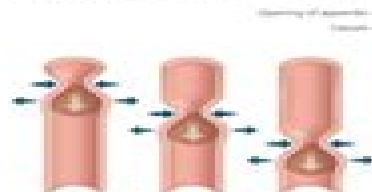

Layers of large intestine

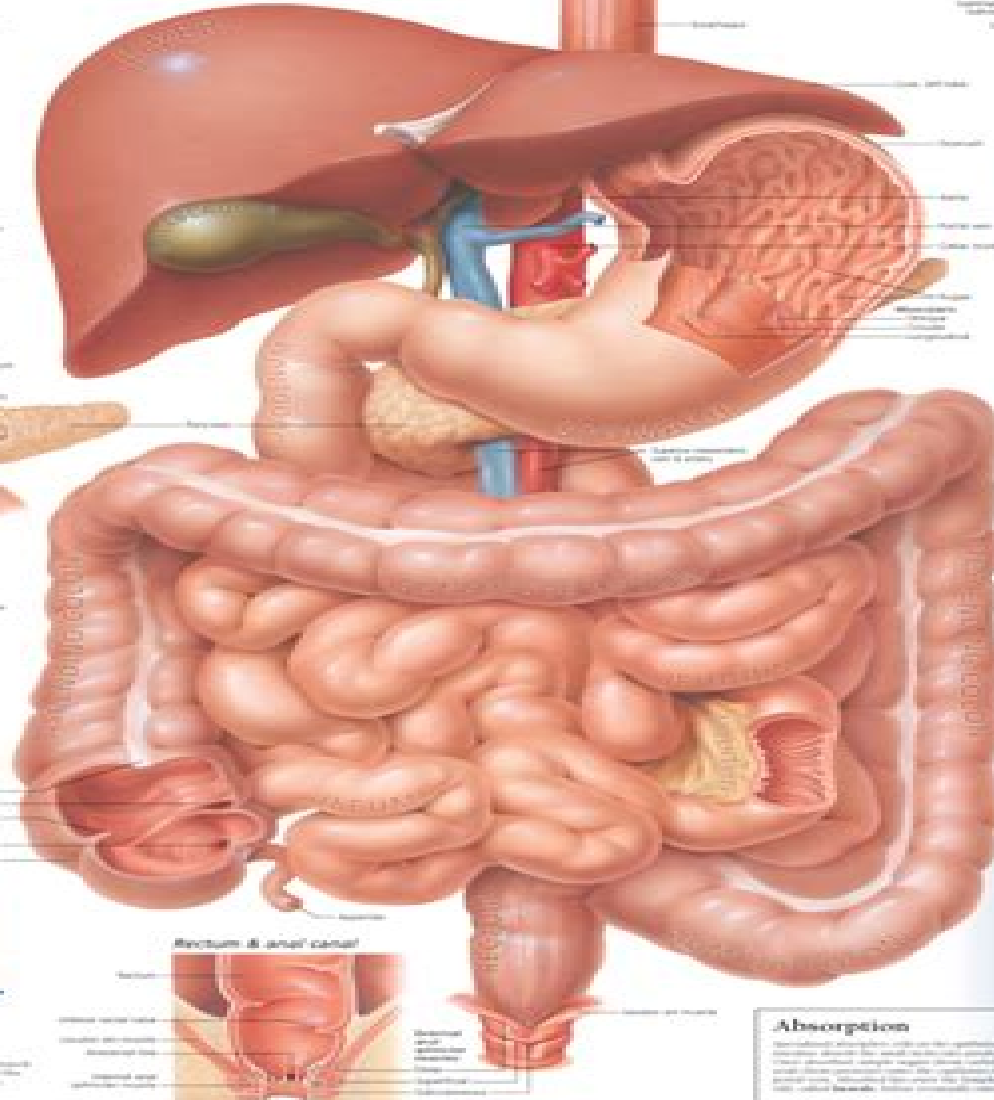

Large intestine

The large intestine consists of the cecum, the appendix, the ascending colon, the transverse colon, the descending colon, and the sigmoid colon. The large intestine is responsible for absorbing water and electrolytes from the undigested food. It also produces and stores feces until they can be eliminated from the body.

Peristaltic action

Food material is pushed through the digestive system by a series of powerful muscular contractions called peristalsis. These contractions move the material forward and the food is broken down as it moves through the system.

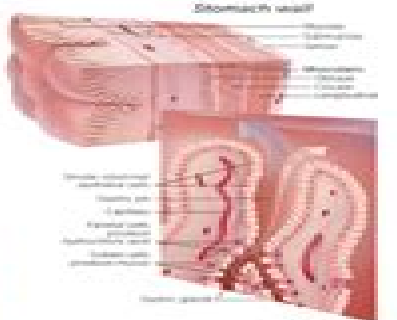

The mouth & salivary glands

Chewing the food breaks it into smaller pieces, making it easier to swallow. Saliva, produced by the salivary glands, moistens the food and helps the enzymes in the saliva break down the food. The salivary glands are located in the mouth and produce saliva, which is secreted into the mouth.

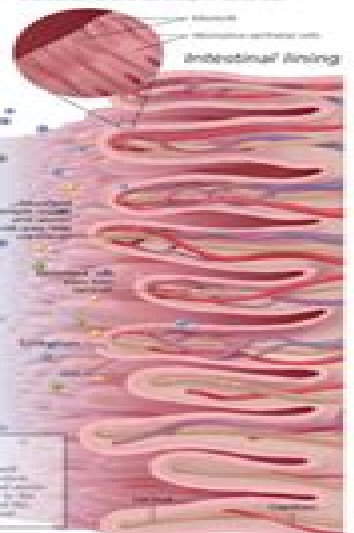

The stomach

The stomach is a large, muscular organ that is responsible for breaking down food into smaller pieces. It is located in the upper abdomen and is connected to the esophagus and the small intestine. The stomach produces gastric juice, which is secreted into the stomach to help break down the food.

Small intestine

The small intestine is a long, coiled tube that is responsible for absorbing nutrients from the food. It is located in the lower abdomen and is connected to the stomach and the large intestine. The small intestine produces intestinal juice, which is secreted into the small intestine to help break down the food.

Absorption

The nutrients from the food are absorbed into the blood and the lymphatic system. The blood carries the nutrients to the rest of the body, while the lymphatic system carries the fat-soluble nutrients. The process of absorption occurs in the small intestine.
