Transfer Dynamics Terence William Barrett, Herbert A. Pohl, 2012-12-06 On three occasions and at different locations conferences were held to honor the eightieth birthday of Professor Herbert Frohlich on the 18th December 1985 in Liverpool England on the 14th February 1986 in Stuttgart Germany and on the 8th March 1986 on the Palm Coast Florida This Festschrift is a compilation of the papers of those conferences Frohlich's choice of problems from the earliest days was couched in the physics of intrinsically interacting systems of excitation One example in which he set the course of research which is still followed concerned dielectric breakdown developed from the 1930s over several decades The interacting systems are the electrons receiving energy from an electric field and lattice atom motion taking energy from the electrons via electron phonon interaction hence heat dissipation There is a threshold field above which the latter cannot keep up with the former and the combined system electrons plus phonons runs away that is to say collectively it switches to a new state
