Bonding Lab: Molecular Model Building

Purpose: The purpose of this lab is to build three dimensional models of several simple covalent molecules and to predict their shapes and polarities.

Pre-Lab Questions

1. Explain the difference between a single, double and triple covalent bond.
2. Explain the difference between a polar and a non-polar bond.
3. Explain the difference between a polar and a non-polar molecule.

Procedure:

Part A: Construct a H_2 , O_2 and N_2 and HF molecule.

1. Why is the HF molecule polar while all the other two-atom molecules were non-polar?
2. What determined how many bonds were formed between the two atoms?

Visualization in Science Education John K. Gilbert, 2006-03-30 Visualization in Science Education draws on the insights from cognitive psychology science and education by experts from Australia Israel Slovenia UK and USA It unites these with the practice of science education particularly the ever increasing use of computer managed modelling packages especially in chemistry The first section explores the significance and intellectual standing of visualization The second section shows how the skills of visualization have been developed practically in science education This is followed by accounts of how the educational value of visualization has been integrated into university courses in physics genomics and geology The fourth section documents experimental work on the classroom assessment of visualization An endpiece summarises some of the research and development needed if the contribution of this set of universal skills is to be fully exploited at all levels and in all science subjects

Electronic Density of States, 1971 **The Structure of Non-crystalline Materials** P. H. Gaskell, 1977 **Journal of Research of the National Bureau of Standards** United States. National Bureau of Standards, 1970 **Molecular Electrostatic Potentials** J.S. Murray, K. Sen, 1996-11-22

Over the past 25 years the molecular electrostatic potential has become firmly established as an effective guide to molecular interactions. With the recent advances in computational technology it is currently being applied to a variety of important chemical and biological systems. Its range of applicability has expanded from primarily a focus on sites for electrophilic and nucleophilic attack to now include solvent effects studies of zeolite molecular cluster and crystal behavior and the correlation and prediction of a wide range of macroscopic properties. Moreover, the increasing prominence of density functional theory has raised the molecular electrostatic potential to a new stature on a more fundamental conceptual level. It is rigorously defined in terms of the electron density and has very interesting topological characteristics since it explicitly reflects opposing contributions from the nuclei and the electrons. This volume opens with a survey chapter by one of the original pioneers of the use of the electrostatic potential in studies of chemical reactivity, Jacopo Tomasi. Though the flow of the succeeding chapters is not stringently defined, the overall trend is that the emphasis changes gradually from methodology to applications. Chapters discussing more theoretical topics are placed near the end. Readers will find the wide variety of topics provided by an international group of authors both convincing and useful.

Congressional Record United States. Congress, 1972 **Physical Chemistry from Ostwald to Pauling** John W. Servos, 2021-05-11

John Servos explains the emergence of physical chemistry in America by presenting a series of lively portraits of such pivotal figures as Wilhelm Ostwald, A. A. Noyes, G. N. Lewis, and Linus Pauling, and of key institutions including MIT, the University of California at Berkeley, and Caltech. In the early twentieth century, physical chemistry was a new hybrid science; the molecular biology of its time. The names of its progenitors were familiar to everyone who was scientifically literate: studies of aqueous solutions and of chemical thermodynamics had transformed scientific knowledge of chemical affinity. By exploring the relationship of the discipline to industry and to other sciences, and by tracing the research of its leading American practitioners, Servos shows how physical chemistry was eclipsed by its own offspring, specialties like quantum chemistry.
